Zur Bedienung und =DCberwachnung sind in die Frontplatte eingebaut : Plate, Load, Bandwahl-Ausgangsschalter, Betriebsartenschalter, Me=DFger=E4teumschalter, Me=DFger=E4t-relativer HF-Output, Me=DFger=E4t-Ia1=/Ua usw., Bandwahl- Eingangsschalter, L=FCfterschalter, L=FCfter schnell/ langsam sowie zwei Leuchtdioden.

Auf der Ger=E4ter=FCckwand befinden sich der Hochspannungsanschlu=DF, Soria=u-Mehrpolstecker, Erdungsschrauben sowie der Amphenolsteckeranschlu=DF zur externen Steuerung. Das gesamte Geh=E4use konnte mit einem feinperforierten Deckel allseitig geschlossen werden.

Wesentliche Informationen sind noch zu den elektrischen Verdrahtungen und Aufbauten noch anzuf=FCgen : S=E4mtliche Spannungsanschl=FC=DFe sind mit Keramikscheiben und MKS-Kondensatoren gegen HF abgeblockt worden. Der Hochspannungsanschlu=DF wurde aus Polyamid hergestellt und hatte eine eingebaute 4 mm Buchse zur Aufnahme des Hochspannungsanschlu=DFsteckers. Als Hochspannungskabel wurde eine spannungsfeste Ausf=FChrung mit 1mm2 Querschnitt gew=E4hlt. Zur Kontaktierung des Verbindungskabels zur Endstufe wurde ein mehrpoliger Soriaustecker bzw. Kupplung gew=E4hlt, wobei der Stecker in die Geh=E4user=FCckwand der Endstufe eingebaut ist. Netzteil und Endstufe wurden au=DFerdem zum besseren Potentialausgleich zus=E4tzlich mit 6 mm2 Erdungs- leitungen verbunden.

S=E4mtlich Hochspannungskabel und Anschl=FCsse sind sowohl im Netzteil wie auch in der Endstufe zus=E4tzlich mit Silikonschl=E4uchen versehen, was ganz erheblich zur besseren Isolierung beitrug. Damit der Spannungsverlust auf den Heizleitungen mit 5V/30 A so gering als m=F6glich blieb, mu=DFten entsprechend starke Kabelquerschnitte verwendet werden (hier 6 mm2). Um die Ausgangs- schwingkreisverluste der Endstufe so gering als m=F6glich zu halten, wurden hier ausschlie=DFlich 14 mm breite und 1 mm starke versilberte Kupferb=E4nder eingesetzt. Die R=F6hrenanschlu=DFsterne sind mit flexiblen, starkgeflochtenen Kupferb=E4ndern zum Auskoppelkondensator C35 (1000 pF/12 KV) verbunden.

Weitere Einzelheiten der Verdrahtung sind direkt dem Schaltplan in den Bildern 1 und 2 sowie den beigef=FCgten Tabellen 3 - 9 zu entnehmen.

4=2E Theoretische Grundlagen

Die Grundlagen dieser Ger=E4tebeschreibung bilden in ersten Linie die praktischen Kenntnisse und Erfahrungen zum Selbstbau einer solchen Linearendstufe. Da es aber nicht ganz ohne die notwendigen theoretischen Kenntnisse geht, die zum Bau einer solchen Endstufe erforderlich sind, wird jeder wissen, der sich schon mit dem Selbstbau befa=DFt. Hier sollen nur die wichtigsten theoretischen Grundlagen kurz erl=E4utert und dargestellt werden, die auch zum Teil bei dem Bau dieser Endstufe mitgewirkt haben. Die grunds=E4tzliche Arbeitsweise einer solchen KW- Linearendstufe wird hierbei vorausgesetzt. Wer dar=FCber hinaus seine Kenntnisse weiter vertiefen m=F6chte, dem sei auf die unten angegeben Literaturquellen hingewiesen.

Wie aus der Grundschaltung in Bild 3 zu sehen ist, wird die

Hochfrequenzleistung =FCber ein breitbandiges Eingangs-Filter symmetrisch in die Katode eingekoppelt.

Die Auskoppelung erfolgt hier durch das vielbew=E4hrte selektive Ausgangs-PI-Filter. Das Gitter der beiden R=F6hren liegt bei der Gitterbasisschaltung, die auch grounded-grid genannt wird, sowohl gleich, wie auch wechsel- spannungsm=E4=DFig direkt an Masse und bildet so eine nat=FCrlich Abschirmung zwischen Katode und Anode, ohne das die R=F6hre ihre Verst=E4rkereigenschaft verliert.

Der Arbeitspunkt wird hierbei =FCber eine automatische Gittervorspannung erzeugt (indem die Katode positiver gegen=FCber dem Gitter gesetzt ist), die durch den Arbeitswiderstand im Katodenkreis, hier die Zenerdiode D 1, festgelegt ist. Der Arbeitspunkt ist so gew=E4hlt, da=DF sich im AB-1-Betrieb eine Katodenspannung von Uk =3D 55 - 60V bei einer Anodenspannung von Ua =3D 2600 V/DC einstellt. Hierdurch ist sichergestellt, da=DF sich der Arbeitspunkt immer noch im teillinearen Bereich der Triodenkennlinie befindet. Der Ruhestrom betrug hierbei 80 mA/R=F6hre. Die beiden Drosseln Dr. 2/3 dienen zur Unterdr=FCckung von Huth-K=FChn-Schwingungen, die durch sch=E4dliche Gitter- Anodenkapazit=E4ten Cg-a1 und Cg-a2 =3D 14 pf hervorgerufen werden. Damit die eingekoppelte HF-Leistung nicht =FCber die Heizleitung zum Netztrafo (direkt geheizte Katode) abflie=DFt, sind zwei Heizdrosseln Dr. 4/5 erforderlich. Sie m=FCssen den Heizstrom (Ih =3D 30 A) und den Katodenstrom (Ikmax. =3D 1,0 A) ohne gro=DFe Verluste f=FChren k=F6nnen. Die hier erstellte Ausf=FChrung hatte einen Querschnitt von ann=E4hernd 3,2 mm2 bei einer Induktivit=E4t von Lh =3D 2,2 mH.

Vorteile der Gitterbasisschaltung mit 2 parallel betriebenen Trioden

* Eingangs- und Ausgangsspannung sind in Phase, es sind keine Neutralisation oder besondere Abschirmungen erforderlich
* die Treiberleistung wird nicht in W=E4rme umgesetzt, sondern durch die Endstufe durchgereicht
* Wahl des Arbeitspunktes im teillinearen Bereich der Triodenkennlinie (geringere nichtlineare Verzerrungen und deren Mischprodukte) im AB-1 Betrieb
* durch die Parallelschaltung l=E4=DFt sich die Ausgangsleistung fast verdoppeln
* einfacher Aufbau des Eingangs- und Ausgangskreises
* geringere Treiberleistung als bei Tetroden oder Pentoden erforderlich
* einfacher Aufbau des Netzteiles, da nur wenige Spannungen erforderlich sind
* finanzieller Vorteil durch die Verwendung von zwei ,,kleineren" R=F6hren gegen=FCber einer wesentlich teureren gro=DFen R=F6hre

Als Nachteile sind zu nennen :

* Summierung der R=F6hrenkapazit=E4ten (Cga1 + Cga2), was zur Herabsetzung der Grenzfrequenz und somit zur Leistungsminderung auf den oberen B=E4ndern f=FChrt
* Beg=FCnstigung von Huth-K=FChn-Schwingungen durch Cgal + Cga2
* durch den sehr niederimpedanten Eingangswiderstand (Re =3D 62.5 Ohm) ist eine relativ hohe Treiberleistung erforderlich

* da zwei Triodenkennlinien keinen absolut gleichen Verlauf aufweisen, steigen die nichtlinearan Verzerrungen (Intermodulationsst=F6rungen und deren Mischprodukte) gegen=FCber der Verwendung von nur einer R=F6hre wieder etwas an

5=2E Berechnung der Eingangs- und Ausgangsbedingungen

Der Eingangswiderstand der R=F6hre berechnet sich gem=E4=DF Bild 4.

Damit liegen die errechneten Eingangs- und Innnenwiderst=E4nde vor: RE ~ 62,5 Ohm, Ri ~ 1,75 KOhm

Aufgabe der Eingangs- und Ausgangs-PI-Filter ist es, den Eingangswiderstand von Zein- =3D 50 Ohm auf Rein~ 62,5 Ohm herauf- und den Innenwiderstand von Ri =3D 1,75 KOhm auf Zaus =3D 50 Ohm herab- zu transformieren. Da die komplexe Berechnung von Filtern den Rahmen dieser Beschreibung sprengen w=FCrde, kann hier nur auf den entsprechenden Literaturquellen verwiesen werden.

Die in Bild 5 aufgef=FChrte Tabelle mit s=E4mtlichen Berechnungen und Werten f=FCr die Ausgangs- PI-Filter wurde nach Unterlagen von DJ6HP (Kurzwellen- und Amateurfunktechnik) und DL3CI (CQ-DL 9/80) zusammengestellt.

Die G=FCte Q wurde hier mit ~11 angesetzt, was in der Praxis einen guten Kompromi=DF zwischen hoher G=FCte (gro=DFe Resonanzstr=F6me und damit verbundenen Verlusten) und selektiver Oberwellenunterdr=FCckung darstellt. Zum Vergleich sind auch noch die einem mit Induktivit=E4tsme=DFger=E4t als Frequenzz=E4hlervorsatz gemessenen und unabh=E4ngig von den PI-Filterberechnungen ermittelten Spulendaten eingetragen.

Die Berechnungsformel f=FCr einlagige Luftspulen ist in Bild 5 mit angegeben.

Die Tabelle in Bild 5 zeigt deutlich, da=DF sich auf den oberen B=E4ndern der induktive Aufbau des Ausgangs-PI-Filters schon bemerkbar macht (errechnete Induktivit=E4t und Sollinduktivit=E4t zur gemessenen Induktivit=E4t).
Ansonsten sind die errechneten Daten in der Gr=F6=DFenordnung zu finden, die sich auch sp=E4ter praktisch einstellten.

Das Eingangsfilter wurde breitbandig ausgelegt und hat eine G=FCte Q von ~ 2.0. Auf ein weiteres Berechnungsbeispiel wurde an dieser Stelle verzichtet. So sind deren Daten direkt der Tabelle 1 aus Bild 6 entnehmbar.

Mit dem Eingangsbandwahlschalter ist auch eine direkte HF-Einspeisung ohne das Eingangsfilter in Schalterposition 7 m=F6glich. Es zeigte sich aber deutlich, da=DF diese kleine Fehlanpassung von Zein =3D 50 Ohm und Rein ~ 62,5 Ohm zu einer Leistungsverminderung von 10 - 20 % am Ausgang der Endstufe f=FChren kann. Au=DFerdem wird der Intermodulationsabstand des Ausgangssignales bei dieser Arbeitsweise um etwa 5 dB geringer anzusetzen sein. Das Stehwellenverh=E4ltnis SWR f=FCr den Endstufeneingang mit diesem Eingangsfilter lag auf allen B=E4ndern unter 1 : 2,0.

6=2E Leistungsverst=E4rkung der Endstufe

Wie aus Tabelle 4 in Bild 8 zu sehen ist, betr=E4gt die Leistungsverst=E4rkung :
V =3D 10 Log. * Pout/Pin (in dB) auf allen B=E4ndern zwischen 9,21 und 9,81 dB.

Diese Leistungsverst=E4rkung reicht aus, um bei einer Ansteuerleistung von 80 - 100 Watt (auf allen B=E4ndern) auch noch sichere 750 Watt - Ausgangsleistung zu erhalten. Der Abfall der Leistungs- verst=E4rkung zu den h=F6heren B=E4ndern, ist bei dem Ansteuertransciver wesentlich st=E4rker ausgepr=E4gt (hier der Kennwood TS-515 mit bis zu 1,2 dB), als bei der Endstufe, wo der Leistungsabfall ca. 0,6 dB betr=E4gt. Dies ist auf den soliden Aufbau des HF-Eingangs- und Ausgangskreises sowie der Verwendung der beiden steilen Trioden zur=FCckzuf=FChren. Der Endstufenwirkungsgrad liegt auch hier, wie erfahrungsm=E4=DF bekannt, im AB-1 Betrieb zwischen 50 - 60%.

7=2E Schaltungsbeschreibung

Wie aus dem Schaltplan des Netzteiles der Linearendstufe in Bild 2 zu sehen ist, sind dort die notwendigen Transformatoren, Gleichrichter und Steuerungelemente untergebracht. Die beiden Hochspannungstransformatoren m4 und m4 werden durch Bet=E4tigung des Steuerrelais d1 (Anodenspannung-EIN) =FCber zwei parallelgeschaltete Widerst=E4nde (R4/R5 von 150 Ohm/7W) eingeschaltet. Deren =DCberbr=FCckung erfolgt zwei Sekunden zeitverz=F6gert durch d2. Diese bekannte Einschaltungsart von gro=DFen Transformatoren vermindert den Rush-Effekt f=FCr konventionelle 16A/H- oder L-Automaten der Netzabsicherung.

Das Hochspannungsnetzteil ist sehr spannungssteif ausgef=FChrt und beinhaltet nur leistungskr=E4ftige Bauteile. Als Hochspannungsgleichrichter ist ein Drehstrombr=FCckengleichrichter mit 4500V/DC Sperrspannung und 1,8 A Nennstrom verwendet. Die Hochspannungsgl=E4ttungskondensatoren bestehen aus zwei Bosch MP-Kondensatoren von jeweils 15uF/3KV. Die erforderlichen Versorgungsspannungen von +165V/0.2A, 12V/2A sind in bekannter Form erzeugt. Alle Spannungen mit Ausnahme der Hochspannung, werden =FCber eine mehrpolige Soriau-Buchse und Stecker zur Endstufe gef=FChrt. Bei hoher Strombelastung (Heizspannung) sind mehrere Steckerstifte parallel geschaltet. Verschiedene Funktionen sind optisch mit Leuchtdioden angezeigt. Verdrahtungsquerschnitte sind im Schaltplan, sofern erforderlich, angegeben.

Im Schaltplan von Bild 1 ist die Endstufe dargestellt.

Da zuvor die theoretischen Grundlagen der Gitterbasisschaltung f=FCr zwei parallelbetriebene Sendetrioden beschrieben worden ist, sind hierzu nur noch wenige Punkte anzuf=FCgen. Mit dem keramischen

Eingangsbandwahlschalter b2 wird das komplette Eingangs-PI-Filter f=FCr alle B=E4nder umgeschaltet. Der keramische Ausgangs- bandwahlschalter b3 ist mit kr=E4ftigen Kontakten (hier f=FCr 50 A) ausgef=FChrt, um die hohen Resonanzstr=F6me ohne gro=DFe Verluste f=FChren zu k=F6nnen. Der Plate-Drehkondensator C 36 hat 250 pF bei 6 KV Spannungsfestigkeit und der Load-Drehkondensator C37 1000 pF bei 3KV Spannungsfestigkeit. Eine deutlich h=F6here Spannungsfestigkeit hat der Auskoppelkondensator C 35 bei 1000 pF/12 KV.

Aus Platzgr=FCnden wurde auf eine Abschlu=DFscheibendrossel L~2,5 mH, die parallel zu C 38 - C 41 liegen m=FC=DFte, verzichtet. Diese Abschlu=DFscheibendrossel und galvanische Kopplung gegen Masse kann verhindern, da=DF bei durchgeschlagenem Auskoppelkondensator C 35 die Hochspannung an der Antenne anliegt. Da der Auskoppelkondensator eine Spannungsfestigkeit von 12 KV aufweist und sich eine maximale Anodenspitzenspannung von 8 KVss einstellt , ist diese M=F6glichkeit allerdings sehr gering. Achtung : Trotzdem immer einbauen !

S=E4mtliche Gitteranschl=FCsse sind mit keramischen Scheibenkondensatoren (C30 - C33 =3D 4700 pF) und Widerst=E4nden (R19 - R22 =3D 3,3 Ohm) abgeschlossen worden. Diese Widerst=E4nde erlauben au=DFerdem eine Gitterspannung bzw. Gitterstrommessung =FCber den Me=DFbereichsumschalter b7 und das Anzeigeme=DFinstrument g2. Der Eingang der Katodendrossel Dr. 1/2 s. Tabelle 3 in Bild 7) ist ebenfalls mit keramischen Scheibenkondensatoren C26/27 =3D 4700 pF abgeschlossen. Die Katodenspannung von 55 - 60 V (vom Mittelanschlu=DF des Heiztrafos =FCber den Steckerpin) stellt sich =FCber eine Reihen- und Parallelschaltung von Dioden (n 24 - n 187) und deren Durch- la=DFspannung ein. Diese Dioden m=FCssen den Katodenstrom (hier max. 1,5 A) sicher f=FChren k=F6nnen und die auch entstehende Verlustw=E4rme Pv - UK * IK =3D 48 Watt (bei ~ Ik =3D 0,8 A) aufnehmen k=F6nnen. Alternativ hierzu sind auch Zenerdioden, die auf einem K=FChlblech isoliert aufgebaut sind, einsetzbar. Da Zenerdioden auf Grund unterschiedlicher Kennlinien und Zenerspannungen nicht parallel schaltbar sind, kommen somit nur leistungsstarke Fabrikate in Frage.

Nachteilig, und das gilt f=FCr beide Katodenspannungserzeugungsarten, ist die Tatsache, da=DF durch die Eigenerw=E4rmung die Diodenschwellspannung und somit auch die Zenerspannung sich etwas nach unten ver=E4ndert. Die in der Praxis ermittelte =C4nderung der Katodenspannung lag in der Gr=F6=DFenordnung von etwa 10 %. Diese Auswirkungen (die Katodenspannung sinkt um etwa 10 % ab), nach der sich der Arbeitspunkt im AB-1 Betrieb etwas n=E4her zum A-Betrieb hin ver=E4ndert und den Katodenstrom etwas ansteigen l=E4=DFt, hatte bei sp=E4teren praktischen Messungen allerdings keine gr=F6=DFeren Auswirkungen.

Das Antennenrelais, eine kr=E4ftige 12V-Ausf=FChrung mit 15A Kontakten, ist in unmittelbarer N=E4he der PL-Buchsen auf Gummiringen zur Schaltger=E4uschverminderung montiert. Die Verbindung vom HF-Ausgangskreis zum Antennenrelais erfolgte mit einem 20 cm kurzen Koaxialkabel RG 58-U. Da sich dieses Koaxialkabel vorz=FCglich verarbeiten und biegen l=E4=DFt, wurden bewu=DFt kleinere Kabelverluste in Kauf genommen.

Ein kr=E4ftiger 230V/AC-Ventilator, der f=FCr eine ausreichende K=FChlung sorgt, ist von der Frontplatte aus auf schnell bzw. langsam umschaltbar. Die gesamte Betriebsartensteuerung ist mit den 12-V Relais d3 - d6 aufgebaut und kann =FCber den Betriebsartenschalter entsprechend vorgew=E4hlt werden. Zur externen PTT-Steuerung ist das Relais d6 benutzt. Eine HF-Vox-Steuerung ist nicht eingesetzt. Dies gilt ebenso f=FCr eine ALC-Spannungsgewinnung vom HF-Ausgangssignal zur Leistungssteuerung des Ansteuertranscievers. Nachteilig war dies beim sp=E4teren Betrieb nicht.

Mit dem Me=DFbereichsumschalter und Anzeigeinstrument g2 k=F6nnen folgende Spannungen und Str=F6me w=E4hrend des Betriebs gemessen werden:
1 - Ua, 2 - Ik, 3 - Igl, 4 - IgR1, 5 - IgR2, 6 - Uver+165V, 7 - Uver +12V

Mit dem Anzeigeinstrument gl ist der relative HF-Output (nicht frequenzkompensiert) moderat angezeigt. Im Stand-by-Betrieb wird die Katodenspannung auf + 165 V gelegt, was zur absoluten Sperrung der beiden Trioden bei Ua=3D2800V ausreicht. Wichtige Schaltungszust=E4nde sind optisch mit den Leuchtdioden LED 3 und 4 signalisiert.

S=E4mtliche Versorgungs- und Steuerspannungen werden gegen die Hochfrequenz mit entsprechenden Kondensatoren abgeblockt. Die Anodendrossel Dr. 3 (s. Tabelle 3 in Bild 7) ist einlagig auf einem Keramikk=F6rper aufgebracht worden und dient zur Zuf=FChrung der Hochspannung in den Anoden- kreis. Der keramische Hochspannungskondensator c34 =3D 5000 pF/5KV blockt hierbei die HF vom ,,kalten Ende" der Drossel ab.

8=2E Verwendete Me=DFger=E4te und Me=DFverfahren

Folgende Me=DFger=E4te und Hilfsmittel standen zum Selbstbau der Linearendstufe zur Verf=FCgung :

* 100 MHz - Zweistrahlloszilloskop, Typ: HM 512 N
* Heathkit - Wattmeter HM 102/1 KW
* Dummyload HN 31/1 KW
* L- und C-Me=DFger=E4te als Frequenzz=E4hlervors=E4tze
* SVR-Me=DFger=E4te 1 KW
* Tongenerator 1 - 100 KHz
* sowie verschiedene konventionelle analoge und digitale Volt- und Ampereme ter.

Leider stand zur Messung des Intermoduationsabstandes und Spektrums kein Zweitonsignalgenerator und Spektrumanalysator zur Verf=FCgung. Der Abstand der Intermodulationsprodukte 3. Ordnung des Ausgangssignales liegt erfahrungsgem=E4=DF bei ca. 40 dB vom Sollsignal und sollte bei Linearendstufen noch etwa um den Faktor der Leistungsverst=E4rkung, hier 9,5 dB, h=F6her anzusetzen sein, damit die effektiven Intermodulationsst=F6rungen und deren Mischprodukte bei gegebenem Abstand zum Sollsignal bei gr=F6=DFerer Ausgangsleistung auch im gleichen Verh=E4ltnis klein bleiben. Beim sp=E4teren Betrieb der Linearendstufe, und dies wurde in vielen QSO's vom jeweiligen Gespr=E4chspartner best=E4tigt, sind keine unerw=FCnschten Verzerrungen oder Splatter sowie Nebenausstrahlungen aufgetreten.

Dennoch sind vor dem Betrieb der Endstufe einige Ausgangssignale oszillographiert, die mit den vorhandenen technischen Mitteln m=F6glich waren. Hierbei war kein sogenanntes flat-topping zu beobachten und die HP-Amplitude zeigte sich als reine Sinusform. Auch konnten keine unerw=FCnschten Phasendifferenzen zwischen Eingangs und Ausgangskreis, die durch falsche =DCbersetzungsverh=E4ltnisse des Ausgangskreises und deren Blindkomponenten entstehen k=F6nnen, festgestellt werden. Solche Phasendifferenzen k=F6nnen ebenfalls zu Fehlanpassungen und Fehlabstimmungen mit den bekannten Auswirkungen f=FChren.

9=2E Praktische Betriebserfahrungen

Die genannte KW-Linearendstufe ist in dieser Applikation mit dem KW-Kennwood-Transciver TS-515 angesteuert. Als Antenne ist ein Doppeldipol f=FCr 80 und 40 m sowie ein Dreielement-Beam von Hygain TH3-MHK in 28 m H=F6he verwandt. Die praktischen Betriebserfahrungen mit dieser Selbstbau-Endstufe sind als sehr gut zu bezeichnen. Auch die Abstimung des Transcivers auf den Endstufeneingangskreis und die Abstimmung des Endstufenausgangskreises an die Antenne ist auf allen B=E4ndern ohne Probleme durchzuf=FChren. Die Stehwellenverh=E4ltnisse betragen auf 10, 15 und 20 m mit dem Beam etwa 1 : 2.0 und bei den Doppeldipolen (die nur 2 m =FCber dem Hausdach aufgebaut sind) etwa 1 : 2,0 bis 1 : 3,2.

Sehr von Vorteil ist auch die Zweistufenumschaltung des kr=E4ftigen Ventilators, der in der zweiten Stufe schon h=F6rbare Windger=E4usche verursacht, die bei leisen Empfangsdurchg=E4ngen st=F6ren k=F6nnen. RTTY- oder CW Betrieb wurde bisher mit dieser Endstufe noch nicht ausge=FCbt. Es zeigten sich aber auch bei langen Phonie-Durchg=E4ngen keine =DCberlastungen der R=F6hren. Die Anoden der R=F6hren erhielten lediglich eine r=F6tliche F=E4rbung, was als ,,normaler". Betriebszustand anzusehen ist. Durch die str=F6mungsg=FCnstige Luftf=FChrung wurde die Verlustw=E4rme auch sehr schnell aus dem Geh=E4use herausgetragen. Ein gro=DFer Vorteil ist ebenfalls die M=F6glichkeit, st=E4ndig alle Spannungen und Str=F6me mit dem eingebauten Me=DFinstrument zu =FCberwachen, ohne hierzu das eingebaute Outputmeter umzuschalten.

Die sichere Funktion, Arbeitsweise und Leistungsf=E4higkeit eines jeden Selbstbauger=E4tes ist hierbei auch der beste Erfolg f=FCr den Funkamateur.

When you are tracking a moving object, aprspoint will record all its positions on the map, and optionally connect them with lines to form a track. If you are tracking multiple moving objects at the same time, the map could get cluttered quickly. In this new version, you can choose to selectively remove an individual object's track, or remove all tracks on the map. This version also includes fixes for several bugs reported by the users. We have also tested it extensively on the Vista platform as well. Old keys will no longer work on this new version, please refer to the web site http://www.aprspoint.com for upgrade details.

This is a small CRT I believe, 41 means long persistance phosphor as
used in radar (slow scan ham use). They were also used in early
Heathkit spectrum display. I may have one in my junk pile.

I came across a couple of old original battery packs (full of defunct
carbon-zincs) that took the innards out of so that i can fill it with
D cells for the "A" voltage and 9v batteries for the "B" power. You
can get the 9v battery connectors at Mouser for to cents apiece by the
hundred, and 5 cents for the pair if you buy just the connector snaps
and solder your own wires. But I thought that it would be good to
have a battery pack that would take just one type of battery at a
minimum number. 6 "D" cells sounds interesting, and should give a
reasonable life. I suppose I could use 10 9v battereis for the "B"
supply and two or three 9v in parallel for the "A" but that is still a
dozen or more batteries and the "A" supply won't last long. Also a
person could use 60 + 6 "AA" cells . . . .
I know at least one person sells a dc/dc converter for Transoceanics
that takes 9 DC cells (+ 1 for the dial light) but they want 90 bucks
for it plus what ever the shipping charge is.

Go to the ARRL.

Unless something has changed in recent years, they'd sell you the back
issue you want, and if they don't have copies, sell you a photocopy of
the specific article.

Hi,

I have built two mixers for a direct conversion receiver. One of them a single transistor mixer, the other one is a single balanced diode mixer. I already have AF amplifier and LO stages. I think both are working fine seperately, but i can't hear anything when i connect the LO and the amplifier to the mixers(either of them of course). Is there any way that i can test these two mixers without test equipment like an oscilloscope or a signal generator? I also don't have a RF probe right now, only a multimeter. Actually i have another questions with this receiver, too, but this is where i am stuck at the moment.

(LO is a crystal controlled one. I built a VFO, too, but didn't manage to get it working, for now.)

Thanks in advance...

==========================================
A good  reason to build such a converter yourself....probably for
peanuts.  A 555 IC ,2 power transistors and a few passive components
Google is your friend.       After all this is THE homebrew NG.

Good Luck

Frank      KN6WH / GM0CSZ

Come to think of it the number does look like a small CRT!
But Heriberto is sure it is transmitting tube, possibly from a marine
service transmitter.
Could the 3P41 be a batch number not a tube type????

developlement - linear rf power amplifier, 2 * T380-1 grid base valves, 3 - 30 MHz, 1 KW

Linear Roehren-Endstufe f�r den Kurzwellen Amateurfunkbetrieb von 3.0 - 30 Mhz und einer Dauerstrichleistung bis 1 KW mit zwei Sendetrioden T-380-1 in Gitterbasisschaltung

ein Selbstbaukonzept f�r lizenzierte Funkamateure entwickelt von Werner Grosse - DK3QV - vielfach nach gebaut von 1983 - 1989

download - http://www.dk3qv.de

1. Einleitung

Diese Beschreibung der Selbstbau KW-Linearendstufe soll diejenige Gruppe der Funkamateure ansprechen, die immer noch mit gro�em Interesse verschiedene Ger�te und Teile Ihrer Funkanlage mit zum Teil bescheidenen Mitteln selbst bauen.Das dazu eine Menge theoretischer und praktischer Erfahrungen, auf dem Gebiet der Elektronik und HF-Technik erforderlich sind, ist fast selbstverst�ndlich. Aber auch Funkamateure, die sich bisher noch nicht so intensiv mit dem Selbstbau verschiedener Ger�te befa�t haben kann diese Baubeschreibung viele praktische Tips und Hinweise liefern. Da die beschriebene KW-Linearendetufe nur von lizenzierten Funkamateuren mit der Lizenzklasse B betrieben werden darf, soll hier vollst�ndigkeitshalber nochmal erw�hnt werden.

2. Ausgangsbasis f�r den Selbstbau einer Kurzwelle

Die Ausgangsbasis f�r den Selbstbau dieser KW-Linearendstufe war einerseits das gro�e Interesse am Selbstbau und andererseits die M�glichkeit eines Nachbaues dieser Endstufe zu schaffen.Da die Kaufpreise von neuwertigen KW-Linearendstufen verschiedener Hersteller meist �ber 2500 DM (verschiedene auch weitaus h�her) liegen und die Einzelpreise der Austausch- oder Ersatzr�hren bis zu DM 500,-/Stck. betragen, kommt auch noch ein finanzieller Aspekt hinzu. F�r diese Endstufe sind fast s�mtliche verwendete Bauteile (sofern nicht in sogenannten Funkbastelkisten vorhanden) mit Ausnahme der beiden Sendetrioden T 380-1, sehr kosteng�nstig auf den von Funkamateuren organisierten Flohm�rkten erworben werden. Der gesamte Aurbeitsaufwand ist, je nach pers�nlicher Begabung des einzelnen und nach Ausstattung der Endstufe, mit etwa 150 - 250 Std. anzusetzen.

Bei der Wahl der Sender�hren und der Ausgangsleistung der Endstufe wurde der neuen DV-AFuG vom 11.12.1981, wonach in Lizenzklasse B die Spitzenausgangsleistung 750 Watt (und wobei die Summe der Anodenverlustleistungen 750 W betragen kann) nicht �berschritten werden darf, Rechnung getragen. Die hier konzipierte Endstufe arbeitet mit 2 parallel betriebenen Sendetrioden des Typs T 380-1 von ABB in der Gitterbasisschaltung und erreicht eine Ausgangsleistung von 750 Watt in allen Betriebsarten und auf allen B�ndern bei einer Ansteuerung von 80 - 100 Watt. Da die Gesamtanodenverlustleistung der beiden R�hren 760 Watt betr�gt, lassen sich diese im AB-1 Betrieb schonend fahren, was den Intermodulationsabstand erh�ht und sich positiv auf die Lebensdauer der R�hren auswirkt. Ein weiterer Vorteil ist die Nutzung der Ausgangsleistung von 750 Watt in allen Betriebsarten und auf allen B�ndern, was auf die enormen Leistungsreserven der R�hren zur�ckzuf�hren ist.

Die beschriebene Endstufe mu� vom mechanischen und elektrischen Aufbau sowie deren Ausstattung nicht unbedingt bindend oder als optimal angesehen werden. Hier sind sicherlich eine Reihe von �nderungsm�glichkeiten denkbar. Dies aber bleibt letztlich jedem Funkamateur, seiner Phantasie und seiner Kreativit�t �berlassen. Diese Beschreibung kann nur die n�tigen Denkanst��e dazu liefern.

3. Mechanischer Aufbau

Durch den gro�en Platzbedarf und das enorme Gewicht der vorhandenen Transformatoren wurde das Netzger�t in einem getrennten Stahlblechgeh�use untergebracht. Das Geh�use der Endstufe war aus verschiedenen 2 mm starken Aluminiumplatten zusammengeschraubt worden und hatte etwa die Abmessungen 380*320*280 mm.

Es leider nicht m�glich, die seinerzeitigen Ansichtsfotos hier abzubilden.

Alle Netzteilbauteile wurden auf einer kr�ftigen 3 mm starken Stahlblechmontagetafel aufgebaut, welche dann mit dem Geh�useboden verschraubt sind. Die notwendigen Bedienungselemente sind in die Frontplatte eingebracht und diverse Anschlu�kabel mit Knickschutzt�llen nach hinten herausgef�hrt. F�r die.elektrischen Verdrahtungen wurden im Netzteil entsprechende L�tleisten aufgebaut. Das gesamte Geh�use ist mit einem U-f�rmigen Deckel verschlie�bar.

Das Alugeh�use der Endstufe war durch ein Zwischenblech so aufgeteilt worden, da� im unteren 100 mm hohen Teil der gesamte HF-Eingangsteil sowie die Steuerung, und im 180 mm hohen oberen Teil der gesamte HF-Leistungsteil untergebracht war.

Im oberen Teil sind folgende Bauteile plaziert : Plate- und Loaddrehkondensatoren, Bandwahlschalter, Auskoppelkondensatoren, Keramikrippenk�rper, Luf'tspule L 10, Anodendrossel und die beiden Sender�hren. F�r ausreichende Luftk�hlung sorgt hier ein Ventilator mit 160 m3/h und eine entsprechende str�mungsg�nstige Luftf�hrung.

Im unteren Teil der Endstufe sind die Bauteile : Steuerungselemente, Verdrahtung, L�tleisten, Steckerzuf�hrung, Hochspannungsanschlu�, R�hrenfassungsanschl�sse, HF-Eingangsteil mit Bahnwahlschalter, Antennenanschl�sse, Antennenrelais sowie die Katodendrossel zu finden.

Zur Bedienung und �berwachnung sind in die Frontplatte eingebaut : Plate, Load, Bandwahl-Ausgangsschalter, Betriebsartenschalter, Me�ger�teumschalter, Me�ger�t-relativer HF-Output, Me�ger�t-Ia1/Ua usw., Bandwahl- Eingangsschalter, L�fterschalter, L�fter schnell/ langsam sowie zwei Leuchtdioden.

Auf der Ger�ter�ckwand befinden sich der Hochspannungsanschlu�, Soriau-Mehrpolstecker, Erdungsschrauben sowie der Amphenolsteckeranschlu� zur externen Steuerung. Das gesamte Geh�use konnte mit einem feinperforierten Deckel allseitig geschlossen werden.

Wesentliche Informationen sind noch zu den elektrischen Verdrahtungen und Aufbauten noch anzuf�gen : S�mtliche Spannungsanschl��e sind mit Keramikscheiben und MKS-Kondensatoren gegen HF abgeblockt worden. Der Hochspannungsanschlu� wurde aus Polyamid hergestellt und hatte eine eingebaute 4 mm Buchse zur Aufnahme des Hochspannungsanschlu�steckers. Als Hochspannungskabel wurde eine spannungsfeste Ausf�hrung mit 1mm2 Querschnitt gew�hlt. Zur Kontaktierung des Verbindungskabels zur Endstufe wurde ein mehrpoliger Soriaustecker bzw. Kupplung gew�hlt, wobei der Stecker in die Geh�user�ckwand der Endstufe eingebaut ist. Netzteil und Endstufe wurden au�erdem zum besseren Potentialausgleich zus�tzlich mit 6 mm2 Erdungs- leitungen verbunden.

S�mtlich Hochspannungskabel und Anschl�sse sind sowohl im Netzteil wie auch in der Endstufe zus�tzlich mit Silikonschl�uchen versehen, was ganz erheblich zur besseren Isolierung beitrug. Damit der Spannungsverlust auf den Heizleitungen mit 5V/30 A so gering als m�glich blieb, mu�ten entsprechend starke Kabelquerschnitte verwendet werden (hier 6 mm2). Um die Ausgangs- schwingkreisverluste der Endstufe so gering als m�glich zu halten, wurden hier ausschlie�lich 14 mm breite und 1 mm starke versilberte Kupferb�nder eingesetzt. Die R�hrenanschlu�sterne sind mit flexiblen, starkgeflochtenen Kupferb�ndern zum Auskoppelkondensator C35 (1000 pF/12 KV) verbunden.

Weitere Einzelheiten der Verdrahtung sind direkt dem Schaltplan in den Bildern 1 und 2 sowie den beigef�gten Tabellen 3 - 9 zu entnehmen.

4. Theoretische Grundlagen

Die Grundlagen dieser Ger�tebeschreibung bilden in ersten Linie die praktischen Kenntnisse und Erfahrungen zum Selbstbau einer solchen

Linearendstufe. Da es aber nicht ganz ohne die notwendigen theoretischen Kenntnisse geht, die zum Bau einer solchen Endstufe erforderlich sind, wird jeder wissen, der sich schon mit dem Selbstbau befa�t. Hier sollen nur die wichtigsten theoretischen Grundlagen kurz erl�utert und dargestellt werden, die auch zum Teil bei dem Bau dieser Endstufe mitgewirkt haben. Die grunds�tzliche Arbeitsweise einer solchen KW- Linearendstufe wird hierbei vorausgesetzt. Wer dar�ber hinaus seine Kenntnisse weiter vertiefen m�chte, dem sei auf die unten angegeben Literaturquellen hingewiesen.

Wie aus der Grundschaltung in Bild 3 zu sehen ist, wird die Hochfrequenzleistung �ber ein breitbandiges Eingangs-Filter symmetrisch in die Katode eingekoppelt.

Die Auskoppelung erfolgt hier durch das vielbew�hrte selektive Ausgangs-PI-Filter. Das Gitter der beiden R�hren liegt bei der Gitterbasisschaltung, die auch grounded-grid genannt wird, sowohl gleich, wie auch wechsel- spannungsm��ig direkt an Masse und bildet so eine nat�rlich Abschirmung zwischen Katode und Anode, ohne das die R�hre ihre Verst�rkereigenschaft verliert.

Der Arbeitspunkt wird hierbei �ber eine automatische Gittervorspannung erzeugt (indem die Katode positiver gegen�ber dem Gitter gesetzt ist), die durch den Arbeitswiderstand im Katodenkreis, hier die Zenerdiode D 1, festgelegt ist. Der Arbeitspunkt ist so gew�hlt, da� sich im AB-1-Betrieb eine Katodenspannung von Uk = 55 - 60V bei einer Anodenspannung von Ua = 2600 V/DC einstellt. Hierdurch ist sichergestellt, da� sich der Arbeitspunkt immer noch im teillinearen Bereich der Triodenkennlinie befindet. Der Ruhestrom betrug hierbei 80 mA/R�hre. Die beiden Drosseln Dr. 2/3 dienen zur Unterdr�ckung von Huth-K�hn-Schwingungen, die durch sch�dliche Gitter- Anodenkapazit�ten Cg-a1 und Cg-a2 = 14 pf hervorgerufen werden. Damit die eingekoppelte HF-Leistung nicht �ber die Heizleitung zum Netztrafo (direkt geheizte Katode) abflie�t, sind zwei Heizdrosseln Dr. 4/5 erforderlich. Sie m�ssen den Heizstrom (Ih = 30 A) und den Katodenstrom (Ikmax. = 1,0 A) ohne gro�e Verluste f�hren k�nnen. Die hier erstellte Ausf�hrung hatte einen Querschnitt von ann�hernd 3,2 mm2 bei einer Induktivit�t von Lh = 2,2 mH.

Vorteile der Gitterbasisschaltung mit 2 parallel betriebenen Trioden

* Eingangs- und Ausgangsspannung sind in Phase, es sind keine Neutralisation oder besondere Abschirmungen erforderlich
* die Treiberleistung wird nicht in W�rme umgesetzt, sondern durch die Endstufe durchgereicht
* Wahl des Arbeitspunktes im teillinearen Bereich der Triodenkennlinie (geringere nichtlineare Verzerrungen und deren Mischprodukte) im AB-1 Betrieb
* durch die Parallelschaltung l��t sich die Ausgangsleistung fast verdoppeln
* einfacher Aufbau des Eingangs- und Ausgangskreises
* geringere Treiberleistung als bei Tetroden oder Pentoden erforderlich
* einfacher Aufbau des Netzteiles, da nur wenige Spannungen

erforderlich sind

* finanzieller Vorteil durch die Verwendung von zwei ,,kleineren" R�hren gegen�ber einer wesentlich teureren gro�en R�hre

Als Nachteile sind zu nennen :

* Summierung der R�hrenkapazit�ten (Cga1 + Cga2), was zur Herabsetzung der Grenzfrequenz und somit zur Leistungsminderung auf den oberen B�ndern f�hrt
* Beg�nstigung von Huth-K�hn-Schwingungen durch Cgal + Cga2
* durch den sehr niederimpedanten Eingangswiderstand (Re = 62.5 Ohm) ist eine relativ hohe Treiberleistung erforderlich
* da zwei Triodenkennlinien keinen absolut gleichen Verlauf aufweisen, steigen die nichtlinearan Verzerrungen (Intermodulationsst�rungen und deren Mischprodukte) gegen�ber der Verwendung von nur einer R�hre wieder etwas an

5. Berechnung der Eingangs- und Ausgangsbedingungen

Der Eingangswiderstand der R�hre berechnet sich gem�� Bild 4.

Damit liegen die errechneten Eingangs- und Innnenwiderst�nde vor: RE ~ 62,5 Ohm, Ri ~ 1,75 KOhm

Aufgabe der Eingangs- und Ausgangs-PI-Filter ist es, den Eingangswiderstand von Zein- = 50 Ohm auf Rein~ 62,5 Ohm herauf- und den Innenwiderstand von Ri = 1,75 KOhm auf Zaus = 50 Ohm herab- zu transformieren. Da die komplexe Berechnung von Filtern den Rahmen dieser Beschreibung sprengen w�rde, kann hier nur auf den entsprechenden Literaturquellen verwiesen werden.

Die in Bild 5 aufgef�hrte Tabelle mit s�mtlichen Berechnungen und Werten f�r die Ausgangs- PI-Filter wurde nach Unterlagen von DJ6HP (Kurzwellen- und Amateurfunktechnik) und DL3CI (CQ-DL 9/80) zusammengestellt.

Die G�te Q wurde hier mit ~11 angesetzt, was in der Praxis einen guten Kompromi� zwischen hoher G�te (gro�e Resonanzstr�me und damit verbundenen Verlusten) und selektiver Oberwellenunterdr�ckung darstellt. Zum Vergleich sind auch noch die einem mit Induktivit�tsme�ger�t als Frequenzz�hlervorsatz gemessenen und unabh�ngig von den PI-Filterberechnungen ermittelten Spulendaten eingetragen.

Die Berechnungsformel f�r einlagige Luftspulen ist in Bild 5 mit angegeben.

Die Tabelle in Bild 5 zeigt deutlich, da� sich auf den oberen B�ndern der induktive Aufbau des Ausgangs-PI-Filters schon bemerkbar macht (errechnete Induktivit�t und Sollinduktivit�t zur gemessenen Induktivit�t).
Ansonsten sind die errechneten Daten in der Gr��enordnung zu finden, die sich auch sp�ter praktisch einstellten.

Das Eingangsfilter wurde breitbandig ausgelegt und hat eine G�te Q von ~ 2.0. Auf ein weiteres Berechnungsbeispiel wurde an dieser Stelle verzichtet. So sind deren Daten direkt der Tabelle 1 aus Bild 6 entnehmbar.

Mit dem Eingangsbandwahlschalter ist auch eine direkte HF-Einspeisung ohne das Eingangsfilter in Schalterposition 7 m�glich. Es zeigte sich aber deutlich, da� diese kleine Fehlanpassung von Zein = 50 Ohm und Rein ~ 62,5 Ohm zu einer Leistungsverminderung von 10 - 20 % am Ausgang der Endstufe f�hren kann. Au�erdem wird der Intermodulationsabstand des Ausgangssignales bei dieser Arbeitsweise um etwa 5 dB geringer anzusetzen sein. Das Stehwellenverh�ltnis SWR f�r den Endstufeneingang mit diesem Eingangsfilter lag auf allen B�ndern unter 1 : 2,0.

6. Leistungsverst�rkung der Endstufe

Wie aus Tabelle 4 in Bild 8 zu sehen ist, betr�gt die Leistungsverst�rkung :
V = 10 Log. * Pout/Pin (in dB) auf allen B�ndern zwischen 9,21 und 9,81 dB.

Diese Leistungsverst�rkung reicht aus, um bei einer Ansteuerleistung von 80 - 100 Watt (auf allen B�ndern) auch noch sichere 750 Watt - Ausgangsleistung zu erhalten. Der Abfall der Leistungs- verst�rkung zu den h�heren B�ndern, ist bei dem Ansteuertransciver wesentlich st�rker ausgepr�gt (hier der Kennwood TS-515 mit bis zu 1,2 dB), als bei der Endstufe, wo der Leistungsabfall ca. 0,6 dB betr�gt. Dies ist auf den soliden Aufbau des HF-Eingangs- und Ausgangskreises sowie der Verwendung der beiden steilen Trioden zur�ckzuf�hren. Der Endstufenwirkungsgrad liegt auch hier, wie erfahrungsm�� bekannt, im AB-1 Betrieb zwischen 50 - 60%.

7. Schaltungsbeschreibung

Wie aus dem Schaltplan des Netzteiles der Linearendstufe in Bild 2 zu sehen ist, sind dort die notwendigen Transformatoren, Gleichrichter und Steuerungelemente untergebracht. Die beiden Hochspannungstransformatoren m4 und m4 werden durch Bet�tigung des Steuerrelais d1 (Anodenspannung-EIN) �ber zwei parallelgeschaltete Widerst�nde (R4/R5 von 150 Ohm/7W) eingeschaltet. Deren �berbr�ckung erfolgt zwei Sekunden zeitverz�gert durch d2. Diese bekannte Einschaltungsart von gro�en Transformatoren vermindert den Rush-Effekt f�r konventionelle 16A/H- oder L-Automaten der Netzabsicherung.

Das Hochspannungsnetzteil ist sehr spannungssteif ausgef�hrt und beinhaltet nur leistungskr�ftige Bauteile. Als Hochspannungsgleichrichter ist ein Drehstrombr�ckengleichrichter mit 4500V/DC Sperrspannung und 1,8 A Nennstrom verwendet. Die Hochspannungsgl�ttungskondensatoren bestehen aus zwei Bosch MP-Kondensatoren von jeweils 15uF/3KV. Die erforderlichen Versorgungsspannungen von +165V/0.2A, 12V/2A sind in bekannter Form erzeugt. Alle Spannungen mit Ausnahme der Hochspannung, werden �ber eine mehrpolige Soriau-Buchse und Stecker zur Endstufe gef�hrt. Bei hoher Strombelastung (Heizspannung) sind mehrere Steckerstifte parallel geschaltet. Verschiedene Funktionen sind optisch mit Leuchtdioden angezeigt. Verdrahtungsquerschnitte sind im Schaltplan, sofern erforderlich, angegeben.

Im Schaltplan von Bild 1 ist die Endstufe dargestellt.

Da zuvor die theoretischen Grundlagen der Gitterbasisschaltung f�r zwei parallelbetriebene Sendetrioden beschrieben worden ist, sind hierzu nur noch wenige Punkte anzuf�gen. Mit dem keramischen Eingangsbandwahlschalter b2 wird das komplette Eingangs-PI-Filter f�r alle B�nder umgeschaltet. Der keramische Ausgangs- bandwahlschalter b3 ist mit kr�ftigen Kontakten (hier f�r 50 A) ausgef�hrt, um die hohen Resonanzstr�me ohne gro�e Verluste f�hren zu k�nnen. Der Plate-Drehkondensator C 36 hat 250 pF bei 6 KV Spannungsfestigkeit und der Load-Drehkondensator C37 1000 pF bei 3KV Spannungsfestigkeit. Eine deutlich h�here Spannungsfestigkeit hat der Auskoppelkondensator C 35 bei 1000 pF/12 KV.

Aus Platzgr�nden wurde auf eine Abschlu�scheibendrossel L~2,5 mH, die parallel zu C 38 - C 41 liegen m��te, verzichtet. Diese Abschlu�scheibendrossel und galvanische Kopplung gegen Masse kann verhindern, da� bei durchgeschlagenem Auskoppelkondensator C 35 die Hochspannung an der Antenne anliegt. Da der Auskoppelkondensator eine Spannungsfestigkeit von 12 KV aufweist und sich eine maximale Anodenspitzenspannung von 8 KVss einstellt , ist diese M�glichkeit allerdings sehr gering. Achtung : Trotzdem immer einbauen !

S�mtliche Gitteranschl�sse sind mit keramischen Scheibenkondensatoren (C30 - C33 = 4700 pF) und Widerst�nden (R19 - R22 = 3,3 Ohm) abgeschlossen worden. Diese Widerst�nde erlauben au�erdem eine Gitterspannung bzw. Gitterstrommessung �ber den Me�bereichsumschalter b7 und das Anzeigeme�instrument g2. Der Eingang der Katodendrossel Dr. 1/2 s. Tabelle 3 in Bild 7) ist ebenfalls mit keramischen Scheibenkondensatoren C26/27 = 4700 pF abgeschlossen. Die Katodenspannung von 55 - 60 V (vom Mittelanschlu� des Heiztrafos �ber den Steckerpin) stellt sich �ber eine Reihen- und Parallelschaltung von Dioden (n 24 - n 187) und deren Durch- la�spannung ein. Diese Dioden m�ssen den Katodenstrom (hier max. 1,5 A) sicher f�hren k�nnen und die auch entstehende Verlustw�rme Pv - UK * IK = 48 Watt (bei ~ Ik = 0,8 A) aufnehmen k�nnen. Alternativ hierzu sind auch Zenerdioden, die auf einem K�hlblech isoliert aufgebaut sind, einsetzbar. Da Zenerdioden auf Grund unterschiedlicher Kennlinien und Zenerspannungen nicht parallel schaltbar sind, kommen somit nur leistungsstarke Fabrikate in Frage.

Nachteilig, und das gilt f�r beide Katodenspannungserzeugungsarten, ist die Tatsache, da� durch die Eigenerw�rmung die Diodenschwellspannung und somit auch die Zenerspannung sich etwas nach unten ver�ndert. Die in der Praxis ermittelte �nderung der Katodenspannung lag in der Gr��enordnung von etwa 10 %. Diese Auswirkungen (die Katodenspannung sinkt um etwa 10 % ab), nach der sich der Arbeitspunkt im AB-1 Betrieb etwas näher zum A-Betrieb hin verändert und den Katodenstrom etwas ansteigen läßt, hatte bei späteren praktischen Messungen allerdings keine größeren Auswirkungen.

Das Antennenrelais, eine kräftige 12V-Ausführung mit 15A Kontakten, ist in unmittelbarer Nähe der PL-Buchsen auf Gummiringen zur Schaltgeräuschverminderung montiert. Die Verbindung vom HF-Ausgangskreis zum Antennenrelais erfolgte mit einem 20 cm kurzen Koaxialkabel RG 58-U. Da sich dieses Koaxialkabel vorzüglich verarbeiten und biegen läßt, wurden bewußt kleinere Kabelverluste in Kauf genommen.

Ein kräftiger 230V/AC-Ventilator, der für eine ausreichende Kühlung sorgt, ist von der Frontplatte aus auf schnell bzw. langsam umschaltbar. Die gesamte Betriebsartensteuerung ist mit den 12-V Relais d3 - d6 aufgebaut und kann über den Betriebsartenschalter entsprechend vorgewählt werden. Zur externen PTT-Steuerung ist das Relais d6 benutzt. Eine HF-Vox-Steuerung ist nicht eingesetzt. Dies gilt ebenso für eine ALC-Spannungsgewinnung vom HF-Ausgangssignal zur Leistungssteuerung des Ansteuertranscievers. Nachteilig war dies beim späteren Betrieb nicht.

Mit dem Meßbereichsumschalter und Anzeigeinstrument g2 können folgende Spannungen und Ströme während des Betriebs gemessen werden:
1 - Ua, 2 - Ik, 3 - Igl, 4 - IgR1, 5 - IgR2, 6 - Uver+165V, 7 - Uver +12V

Mit dem Anzeigeinstrument gl ist der relative HF-Output (nicht frequenzkompensiert) moderat angezeigt. Im Stand-by-Betrieb wird die Katodenspannung auf + 165 V gelegt, was zur absoluten Sperrung der beiden Trioden bei Ua=2800V ausreicht. Wichtige Schaltungszustände sind optisch mit den Leuchtdioden LED 3 und 4 signalisiert.

Sämtliche Versorgungs- und Steuerspannungen werden gegen die Hochfrequenz mit entsprechenden Kondensatoren abgeblockt. Die Anodendrossel Dr. 3 (s. Tabelle 3 in Bild 7) ist einlagig auf einem Keramikkörper aufgebracht worden und dient zur Zuführung der Hochspannung in den Anoden- kreis. Der keramische Hochspannungskondensator c34 = 5000 pF/5KV blockt hierbei die HF vom ,,kalten Ende" der Drossel ab.

8. Verwendete Meßgeräte und Meßverfahren

Folgende Meßgeräte und Hilfsmittel standen zum Selbstbau der Linearendstufe zur Verfügung :

- 100 MHz - Zweistrahlloszilloskop, Typ: HM 512 N
- Heathkit - Wattmeter HM 102/1 KW
- Dummyload HN 31/1 KW
- L- und C-Meßgeräte als Frequenzzählervorsätze
- SVR-Meßgeräte 1 KW
- Tongenerator 1 - 100 KHz
- sowie verschiedene konventionelle analoge und digitale Volt- und Amperemeter.

Leider stand zur Messung des Intermoduationsabstandes und Spektrums kein Zweitonsignalgenerator und Spektrumanalysator zur Verf�gung. Der Abstand der Intermodulationsprodukte 3. Ordnung des Ausgangssignales liegt erfahrungsgem�� bei ca. 40 dB vom Sollsignal und sollte bei Linearendstufen noch etwa um den Faktor der Leistungsverst�rkung, hier 9,5 dB, h�her anzusetzen sein, damit die effektiven Intermodulationsst�rungen und deren Mischprodukte bei gegebenem Abstand zum Sollsignal bei gr��erer Ausgangsleistung auch im gleichen Verh�ltnis klein bleiben. Beim sp�teren Betrieb der Linearendstufe, und dies wurde in vielen QSO's vom jeweiligen Gespr�chspartner best�tigt, sind keine unerw�nschten Verzerrungen oder Splatter sowie Nebenausstrahlungen aufgetreten.

Dennoch sind vor dem Betrieb der Endstufe einige Ausgangssignale oszillographiert, die mit den vorhandenen technischen Mitteln m�glich waren. Hierbei war kein sogenanntes flat-topping zu beobachten und die HP-Amplitude zeigte sich als reine Sinusform. Auch konnten keine unerw�nschten Phasendifferenzen zwischen Eingangs und Ausgangskreis, die durch falsche �bersetzungsverh�ltnisse des Ausgangskreises und deren Blindkomponenten entstehen k�nnen, festgestellt werden. Solche Phasendifferenzen k�nnen ebenfalls zu Fehlanpassungen und Fehlabstimmungen mit den bekannten Auswirkungen f�hren.

9. Praktische Betriebserfahrungen

Die genannte KW-Linearendstufe ist in dieser Applikation mit dem KW-Kennwood-Transciver TS-515 angesteuert. Als Antenne ist ein Doppeldipol f�r 80 und 40 m sowie ein Dreielement-Beam von Hygain TH3-MHK in 28 m H�he verwandt. Die praktischen Betriebserfahrungen mit dieser Selbstbau-Endstufe sind als sehr gut zu bezeichnen. Auch die Abstimung des Transcivers auf den Endstufeneingangskreis und die Abstimmung des Endstufenausgangskreises an die Antenne ist auf allen B�ndern ohne Probleme durchzuf�hren. Die Stehwellenverh�ltnisse betragen auf 10, 15 und 20 m mit dem Beam etwa 1 : 2.0 und bei den Doppeldipolen (die nur 2 m �ber dem Hausdach aufgebaut sind) etwa 1 : 2,0 bis 1 : 3,2.

Sehr von Vorteil ist auch die Zweistufenumschaltung des kr�ftigen Ventilators, der in der zweiten Stufe schon h�rbare Windger�usche verursacht, die bei leisen Empfangsdurchg�ngen st�ren k�nnen. RTTY- oder CW Betrieb wurde bisher mit dieser Endstufe noch nicht ausge�bt. Es zeigten sich aber auch bei langen Phonie-Durchg�ngen keine �berlastungen der R�hren. Die Anoden der R�hren erhielten lediglich eine r�tliche F�rbung, was als ,,normaler". Betriebszustand anzusehen ist. Durch die str�mungsg�nstige Luftf�hrung wurde die Verlustw�rme auch sehr schnell aus dem Geh�use herausgetragen. Ein gro�er Vorteil ist ebenfalls die M�glichkeit, st�ndig alle Spannungen und Str�me mit dem eingebauten Me�instrument zu �berwachen, ohne hierzu das eingebaute Outputmeter umzuschalten.

Die sichere Funktion, Arbeitsweise und Leistungsf�higkeit eines jeden Selbstbauger�tes ist hierbei auch der beste Erfolg f�r den Funkamateur.

And you have verified that the LO is working?

```

I found this in a news group and decided to try it. A little while back,
I was browsing through news groups, just like you are now and came across a message just like this, that said you could make thousands of dollars within weeks with only an initial investment of $6.00!!!

So I thought yeah right, this must be a scam!!! But like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and addresses stated in the message. You then place
your own name and address at the bottom of the list at #6 and post the message in at least 200 news groups. (There are thousands). No catch, that was it.

So after thinking it over, and talking to a few people first. I thought
about trying it. I figured, what have I got to lose except 6 stamps and
$6.00, right? So I invested the measly $6.00!!! Guess what? Within 7 days I started getting money in the mail!!! I was shocked!!! I figured it would end soon, but the money just kept coming in!!! In my first week, I had made about $25.00. By the end of the second week, I had made
a total of over $1,000.00!!! In the third week, I had over $10,000.00 and it is still growing!!! This is now my fourth week and I have made a
total of just over $42,000.00 and it is still coming in rapidly!!! It's
certanly worth $6.00 and 6 stamps!!! I have spent more than that on the
lottery!!!

Let me tell you how this works and most importantly, why it works!!! Also, make sure you
print a copy of this message now. So you can get the information off of
it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible
by doing something so easy!!!

Suggestion: Read this entire message carefully!!! (Print it out or download it.) Follow the simple directions and watch the money come in!!! It's easy!!! It's legal!!! Your investment is only $6.00 (plus postage).

IMPORTANT: This is not a rip-off!!! It is not illegal!!! ? It is almost entirely risk free and it really works!!! If all of the following instructions are adhered to, you will recieve extraordinary dividends!!!

Please note: Follow these directions EXACTLY, and $60,000.00 or more can be yours in 20 to 90 days!!! This program remains successful because of the honesty and the integrity of the participants!!! Please continue its success by carefully adhering to the instructions.

You will now become part of the mail order business. In this business your product is not solid or tangible, it is a service. You are in the business of developing mailing lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from a mailing list is secondary to the income which is made from people like you and me asking to be included on your mailing list!!!

Here are the 4 easy steps to success:

Step 1: Get 6 seperate pieces of paper and write the following on each piece of paper.

PLEASE PUT ME ON YOUR MAILING LIST

Now get 6 U.S. dollar bills and place ONE inside each of the 6 pieces of paper so the bills will not be seen through the envelopes (to prevent mail theft). Next, place one paper in each of the 6 envelopes and seal them, you should now have 6 sealed envelopes. Each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. THIS IS ABSOLUTELY LEGAL!!! YOU ARE REQUESTING A LEGITIMATE SERVICE AND YOU ARE PAYING FOR IT!!!

Like most of us, I was a little skeptical and a little worried about the legal aspect of it all. So I checked it out with the U.S. Postal Service and they confirmed that it is indeed legal!!!

Mail the 6 envelopes to the following addresses:

L.R.M.
1107 Panama St.
Houston, TX 77009

A.M.R.
23645 Cora
Brownstown, MI. USA 48183

K. Costello
20812 135 Ave SE
Kent, WA 98042 USA

B. Brown
1208 Steeple Ridge Ct
McKinney, Tx 75069 USA

J.Tompson
65-54 parsons blivd apt 1a
Flushing, NY
11365

Mourgo
27 Major Mackenzie Dr.
Suite 201
Richmond Hill, ON
L4C 1G7 CANADA

Step 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add your name as number 6 on the list.

Step 3: Change anything you need to, but try to keep this message as close to what you see as possible. Now, post your amended message to at
least 200 news groups. I think there are close to 24,000 groups!!! All you need is 200, but remember, the more you post, the more money you make!!! This is perfectly legal!! If you have any doubts, refer to Title18 sec. 1302 & 1341 of the postal lottery laws. Keep a copy of these steps for yourself and whenever you need money, you can use it again.

Please remember that this program remains successful because of the honesty and the integrity of the participants and by their carefully adhering to the directions!!!

Look at it this way. If you are of integrity, the program will continue
and the money that so many others have recieved will come your way!!!

Note: You may want to retain every name and address sent to you, either on your computer or hard copy and keep the notes people send you. This verifies that you are truely providing a service. Also, it might be a good Idea to wrap the $1 bills in dark paper to reduce the risk of mail theft.

So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a list developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position, you will be receiving thousands of dollars in cash!!! What an opportunity for only $6.00!!! ($1.00 for each of the first six people listed above).

Send it now, add your own name to the list and your in business!!!

DIRECTIONS FOR HOW TO POST TO A NEWS GROUP!!!

Step 1: You do not need to re-type this entire message to do your own posting. Simply put your cursor at the beginning of this message and drag your cursor to the bottom of this message and select copy from the edit menu. This will copy the entire message into the computer memory.

Step 2: Open a blank note pad file and place your cursor at the top of the blank page. From the edit menu select paste. This will paste a copy of the message into notepad so that you can add your name to the list.

Step 3: Save your new notepad file as a txt file. If you want to do your posting in a different setting, you'll always have this file to go back to.

Step 4: Use netscape or Internet Explorer and try searching for various news groups (on-line forums, message boards, chat sites, discussions, etc.)

Step 5: Visit these message boards and post this message as a new message by highlighting the text of this message from your notepad and selecting paste from the edit menu. Fill in the subject, this will be the header that everybody sees as they scroll through the list of postings in a particular group. Click the post message button. You've done your first one! Congratulations!!! All You have to do is jump to different news groups and post away, after you get the hang of it, it will take about 30 seconds for each news group!

REMEMBER, THE MORE NEWS GROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!!!! (But you have to post a minimum of 200).

Thats it!!! You will begin receiving money from around the world within days!!! You may eventually want to rent a P.O. Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT!!!

Now the why part. Out of 200 postings, say you recieve only 5 replies (a very low example). So then you made $5.00 with your name at #6 on the letter. Now, each of the 5 persons who sent you $1.00 make the minimum 200 postings, each with your name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for you. Now those 25 each make 200 MINIMUM posts with your name at #4 and only 5 replies each, you will bring in an additional $125.00!!!! Now, those 125 persons turn around and post the minimum 200 with your name at #3 and only recieve 5 replies each, you will make an additonal $625.00!!! OK, now here is the fun part, each of those 625 persons post a minimum 200 messages with your name at #2 and they each only recieve 5 replies, that just made you $3,125.00!!! Those 3,125 persons will all deliver this message to 200 news groups, If just 5 more reply you will receive $15,625.00!!! All with an original investment of only $6.00!!! Amazing isn't it!!!! When your name is no longer on the list, you just take the latest posting in the news groups and send out another $6.00 to the names on the list, putting your name at number 6 again.

You must realize that thousands of people all over the world are joining the internet and reading these messages every day!!! Just like you are now!!! So, can you afford $6.00 and see if it really works? I'm glad I did!!! People have said, "what if the plan is played out and no one sends you the money?" So what!!! What are the chances of that happening, when there are tons of new honest users and new honest people who are joining the internet and news groups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day!!!

REMEMBER PLAY HONESTLY AND FAIRLY AND THIS WILL REALLY WORK!!!

IF EVERYONE PLAYS BY THE GAME AND SENDS THEIR $1 THERE IS NO SCAM! I HAVE LOOKED AT IT IN EVERY POSSIBLE ANGLE AND NOT ONLY ONE PERSON IS BENEFITING...WE ALL ARE IF WE FOLLOW THE INSTRUCTIONS. THINK ABOUT IT. WHAT DO YOU HAVE TO LOSE? THAT'S RIGHT $6! TRY IT!

It would take a pretty lousy mixer to not get some mixing action. And since you hve an audio amplifier following it, even weak mixing action should provide a signal.

Hence the first step is to get a second local oscillator close to the frequency of the existing one, and then you'll hear the beat note out of the audio amplifier if things are working to some extent. If you only have crystal oscillators on the same frequency, they might not be far apart enough to get much of a beat note, but you'd be seeing some cycling of the output of the mixer (because the oscillators are beating together to generate an output so low in frequency that you can see it rather than hear it).

Stop one of the oscillators, and if that cycling goes away then you know things are working to some extent.

The advantage of crystal oscillators is that you can get some 4pin TTL oscillators cheap, and they will be strong enough to check things out. Their exact frequency won't matter at this point but wire them up properly and you can be fairly certain that they will work, unlike building up oscillators from scratch. Your problem might be that the mixer isn't working properly so only strong signals will result in output.

Once you get some mixing action then you can move one oscillator away from a direct connection to the mixer, and treat it like a "weak" signal coming in through the antenna.

Make an RF probe, a coupling capacitor and a diode and a load resistor, and connect it to your multimeter. (Make it a "probe" in that the coupling capacitor should have short lead connect directly to the rest of your probe circuit. You then touch the short capacitor lead directly to the oscillator, rather than running a long lead between the oscillator and the probe.) Since it's DC coupled, you won't get a reading on the meter unless the oscillator is oscillating. YOu can always verify by removing power from the oscillator, and when the needle drops, you know the oscillator has been turned off. Of course, one has to be careful because if you load down the oscillator too much, that may kill the oscillation.

If you have a shortwave radio, tune it to try to find your oscillators, to see if they are oscillating, and in the case of the LC oscillator, where its frequency is. If you don't have an oscillator at a suitable frequency, then you might not know if things are working if there's no signal on that frequency.

```

I think it is, because when i turn it on with an alligator clip
attached to it's output, i hear a humming sound at the nearby receiver
- which is an envelope detector connected to a LM386 amplifier. It
means that it's working, right?

Actually, i first tought, that if i would connect the LO to the mixer and attach a long wire to the antenna port, i could hear something useful that is near the crystal frequency (7159 KHz) and determine if the mixer is working or not. A funny thought i guess.

So back to your suggestion; I have a few more of these crystals and i can build a second same oscillator for this test. I will also try the cheap TTL oscillators you mentioned if the above test fails. If it doesn't work too, i think i can be sure that the mixer isn't working. (By the way, i've got the oscillator schematic from http://www.geocities.com/raiu_harrison/mwa/tech/circuits/osc-xtal.html this page (the first one))

I would like to build a diode-ring mixer which is mentioned everywhere on the net, but those toroids used in transformers are just too hard to find here. That's why i used a ferrite rod, salvaged from an old radio, in that diode mixer. Should using ferrite rods or other core materials instead of toroids cause problems?

I build the RF probe you explained on a piece of PC board (got the component values from the N5ESE's Classic RF Probe page) and when i get the coaxial cable, that is needed to connect it to the multimeter, i will test those oscillators with it, too. And i have digital meter not an analog one. But both should work OK, i think.

And lastly, i don't have a shortwave receiver but when i go to buy some stuff again, i will also get some crystals whose frequency is in the AM band in order to listen for the oscillator signal in an AM

```
radio.

Thank you for your interest..

I had to go back and delete that log post.

This is a pyramid scheme, and it is most definitely illegal. This is an old, old, scam. In this pyramid scheme, they try to pretend to get around the law by offering a "service". The legal entities here in the U.S. do not buy that cover, and will prosecute as per a pyramid scheme anyway. This so-called mailing list service never did work as a cover, and never will. In this scam, usually only the last name on the list, the originator of the scam, is valid. The other names are made up, taken from some other pyramid scheme list, or taken from a public record like a phone book.   Notice the last name on the list - a Canadian address. He thinks that he can skirt the law by living outside the US, but this is also illegal in Canada. He spammed a lot of groups, and he did not bother to create a profile. His e-mail is incrediblejoe@gmail.com.

I filed a complaint with the a complaint with the Internet Crime Complaint Center (IC3) in Canada, which is part of the Royal Canadian Mounted Police (RCMP). And the The Canadian Anti-fraud Call Centre (CAFCC). If anyone can think of another agency to report this guy to in Canada, Please do so. Is there a Canadian Attorney General?

How nice. An upgrade fee for one small enhancement (fix that should have been in the program originally) and some bug fixes. This program needs some major enhancements. These little enhancements and bug fixes every six months to a year are not cutting it. Stay away from APRSPoint. The author is ripping people off.

Well, I'm back. Still looking for a one tube regenerative receiver I
can build for myself. I did
manage to find a kit online that looks close to what I want - it's
called the Radio Ace kit.
Made to look like the old Radiomann sets they used to sell back in the
day, it looks nice,
but at $100+ it seems it was made for people with more money than
brains.

Back to the topic. I found the schematics for the Doerle Twinplex
receiver, which should do
the trick, with one exception - the tube it uses isn't one of the
tubes I have. I do have three
different twin triodes that are of more recent vintage, but I don't
know if I can substitute any
or all of them in the circuit. The are a 4BC8, a 6FQ7 and a 6BZ7.
Anybody have any ideas?

Ralph Glatt

Well the 4BC8 has a 4.2 600ma heater, it could run on 6v through a voltage dropping resistor. It has a mu of 35 (both triodes).

The 6FQ7 is very similar to the 6CG7 (only difference is that the 6CG7 has an internal shield between the two triode sections). It has a 6.3v 600ma heater and both triodes have a mu of 20.

The 6BZ7 has 6.3v 400ma heater and a mu of 36 (both sections).

The 6BZ7 would probably be the best choice as it is the lowest power version tube and has the most gain.

The parameters of a tube in this circuit are not that important, any tube will work well. Adjustment of the grid leak resistor and capacitor as well as the number of turns in the tickler coil in the detector circuit as well as the cathode bias resistor in the amplifier circuit will be necessary with a tube change, but even here the values won't be critical. Anyway I'd use the 6BZ7.

Thanks for the replies.  This oscillator is cool, but not what I saw
before.  I tried another Google search and can't find the one I saw.
Maybe disappeared out in cyberspace somewhere.
Larry

Hi, Everybody,

Would anybody know offhand which rigs from maybe the 1960s through early 1980s era had an IF of 10.9 MHz? I have a number of 10.9 MHz crystal filters built by Network Sciences (C-F Networks) that I bought some time ago that were supposedly taken out of a ham rig and just out of curiosity wanted to know which one.

Thanks very much.

Regards,

Al W6LX

ISTR that some older Bearcat scanners used 10.9Mhz. I don't know any
other rigs using it though.

Michael makes excellent points...

Sunday I was struggling with a simple crystal oscillator I had kludged up on a protoboard for a quick project... I have been building oscillators like this on and off for over 40 years, yet I could not get this one to work... Tried different crystals... Used the LC meter to check the caps and inductor... Used a VOM to trace the circuit and measure the resistors... Had the oscilloscope and a receiver monitoring the circuit for RF... I was just tearing my hair out... My son got involved and he could not find a problem either...

As we sat there staring at the half dozen components on the protoboard I commented that the bias voltages on the FET showed that it was conducting, but not oscillating as if something was sucking the RF to ground... On a whim I said to him, pull the RF bypass cap off the 5 volt DC line... (the LC meter had showed the cap as good and close to the 0.1 mfd it was marked)...

Ahh that won't change anything because the RF choke blocks the rf from getting that far, he said...

Well, just try it..

He reached over and idly plucked the DC bypass cap off the DC input line and WHAMMO, instant loud, whistle in the receiver and the oscilloscope showed a solid sinewave...

He looked at me, I looked at him, we both shrugged and he tossed the cap into the wastebasket...

It's the little things that will drive you to drink...

So, first verify that your oscillator is oscillating - receiver or oscilloscope or RF probe to your VOM... It is not just some white noise in the radio, but a solid whistle that indicates the oscillator is working... As Michael suggested use a second oscillator as a BFO if your receiver doesn't have a SSB or CW mode...

Next, put an audio signal into the audio amp and verify that it blows the headphones off your head... Just suck some audio off a receiver to feed it...

Once you KNOW these items work then try your mixer... Start with the transistor mixer first...

Building or buying an RF probe for your VOM will be the most versatile and cost effective tool you can make/buy for these projects..

GL - denny / k8do

I have seen 10.9 MHz crystal filters used in RC receivers from the
60's and 70's. Don't know if it was a technical reason or just "vendor
lock-in" for the channelized crystals (that's what the modelers told
me it was).

Tim.

I had one of these moments decades ago. Short version of a very long story, and beginning doubts about whether reality exists or magic exists: I built a circuit that didn't work but was supposed to work. Spent a LOT of time. Finally, on an intuitive whim I added a component that should not have done anything, but it made the circuit work. I told my boss, we looked at each other, and we decided it was not worth spending more time on and accepted the modification since what mattered was that the damned thing work and we were not going to question black cats crossing our paths. :-\

I finally tested the circuit. I started with the transistor mixer as you said. After being sure that the oscillators was working, i connected them to the mixer and turned both of them on. When i turned on the second one, i started to hear some strong low frequency cycling, as you said before. When i turned off one of the oscillators, the sound was gone. So that shows the mixer is working, i guess.

I have seen some crystal oscillator circuits with a trimmer connected in series with the crystal. I thougt, that way i could generate some higher frequency sound. I connected a trimmer to one of the oscillators and it made the circuit output a real 'beat note'. I could change the tone frequency with adjusting the trimmer. It could even generate frequencies as high as 2 KHz. I didn't think that this small trimmer could change the oscillation frequency that much.

I also experienced some strange things. While playing with that trimmer, i found out that the mixer's power connection was lying on the table. I connected it again, but it didn't change anything. Circuit went on working as before. Is this BJT mixer capable of mixing without power applied? And even the two oscillators were exactly same, i found that one of them were more sensitive than the other one. Touching the trimmer with a screwdriver changed the frequency like 400-500 Hz, while with the other one, it had no effect.

After then, as you suggested, i disconnected one of the oscillators and moved it a bit far away from the mixer. I could still hear it from

1-2 meters away. I turned off the mixer to see if it works with this situation too, but when i turned it off, i couldn't hear the other oscillator even from 10 cm's. What about this?

I will test the diode mixer, too, but i have some problems with the transformer right now. Until then, i will play with this one and see if i can hear some real stuff with this. Do you think it is possible with this simple setup, and with a long wire?

Thanks....

Sounds like the one oscillator is not working the way you think...

Yes, a transistor is a pair of diodes nose to nose, and can mix/
rectify without being powered.. But will need power to work as
intended...

Look, take a diode and a cap and a resistor and make an RF probe for
your VOM... Look in the ARRL handbook, or the RSGB, or just about any
handbook for this RF probe circuit..

Cheers ... denny

Hey Michael,

Yes, I am about ready to join the ARRL just to have access to their
"Hands-On-Radio" articles from the past couple years.  These things are
exactly what I have been looking for...

Thanks,

Dave

The '3 series of mixer from MCL are good down to about 25kHz. Good performance can be expected another octave down from there. Does the synthesizer in your WJ receiver provide +17dBm of LO injection? The mixer you ordered is a Level 17 mixer. The MCL website does have the pinout for this device. I like the '3 series, since the SSB conversion loss is in the 4.75dB range vs other series, which have conversion loss in the 6.5dB range. This is a very good mixer. Now, which mixer is your WJ receiver using? Some of the WJ units used a mixer that had a pinout similar to MCL's GRA-3.

Pete

I bought this 8718 as a parts unit and now have it working, somewhat. The can that covers the mixer is gone, someone was messing inside but the manual has it as M9D made by WJ I think. I wish I could find a schematic on it becasue it might be repairable, kind of small but I've looked at it with my 6-50 stereo zoom microscope and might be able to fix it if I knew what diodes it used. Without a diagram I'm afraid that I might bugger something.

When I attach a 5 foot piece of wire to one the diodes the radio picks up
all the AM stations and no problem with WWV or 20 meters..Haven't done any
other testing. I was told that the SRA-3H was a good sub and took their
word for it. If something else is closer or better I'd sure like to know. I
can't find any reference in the manual to the output level of the first LO
but it covers ~ 43 to 73 MHz.

Hi All,
Please see pictures and diagram at ABSE.

I duplicated a circuit for someone because they got a bad output waveform.
Well I did too.
Capacitor = air variable set at 365pf
inductor = 41uh aircore
With freq set at 1.3Mhz I have the voltages as follows;
Collector - 11.8vdc
Base - 3.1vac riding on top of 3.2vdc
Emitter - 2.5vac riding on top of 3.9vdc   (Don't be critical, it's not ac if it sets on dc)

As I shift up in freq at about 2.7Mhz the voltages jump.

Capacitor = air variable set at 40pf
inductor = 41uh aircore
Freq = 3.7Mhz
Collector - 11.8vdc
Base - 10vac riding on top of 1.8vdc
emitter - 1.1vac riding on top of 9vdc

The base waveform in both senerios is much more sinewave (ish) than the output.

Any ideas how to get a decent waveform? The next step will be a buffer, but...

Note; original schematic used a crystal, I substituted the LC. Could this

be the
cause of the distortion?

Thanks,   Mike

Mike ,

What is ABSE? Need a circuit before comments can be made.

Roger

I checked my WJ databook, and I was wrong about that GRA-3 pinout. The SRA-3H does have the same pinout as the M9D, so it is a drop-in replacement.
The original mixer is indeed a Level 20 mixer, which means that you LO injection level is +20dBm. It is rated at 6.5dB conversion loss over the 2 to 400MHz range. This means that it won't have the greatest performance in the LW/MW range.
The IP3 is +30dBm, which is a bit better than the SRA-3H.
A better mixer to use would be the MCL TAK-3H. This mixer has an IP3 of +29dBm and a conversion loss in the 4.77dB range. The TAK-3H is rated down to 40kHz. I used to use the TAK-3H as a drop-in replacement for the 1st mixer when I upgraded KWM-380s.
You can't go wrong with this mixer. The original diodes are probably HP1N5711 hot-carrier diodes. I would throw in the TAK-3H..........performance will be enhanced over the original design. You will have a 1.7dB improvement in the noise figure, and to do that without the need for RF amplification ahead of this stage is a bonus.

Pete

>*indirectly* heated tubes such as the 8877...

I don't know if I would agree with that. The 8877 has a 5v 10A heater. While that is 'only' 50 watts of power, it is a resistance of only 1/2 ohm WHEN HOT. When cold, the heater might have a resistance of only .05 ohms, and represent an inrush of almost 100 AMPS. While an indirectly heated cathode's heater element is somewhat protected against thermal shock by the surrounding cathode, at this current level some inrush delay might still be a good idea with such an expensive tube. It also might prevent premature burnout of the filament transformer!

Well, offhand, I don't like the way the base is biased... That transistor will be clamping on the negative voltage swing which probably answers why the waveform is so poor.

If you make a voltage divider for the base voltage, the transistor oscillato ought to give a better waveform.

Perhaps something like 27K from +12 VDC to the basen, and 9.1 K from base to ground.

This should improve the waveform shape....

The only reason for splitting up the 24 hours into cycles was to thermal-cycle the relevant tube components. It may be mythology, but

I've heard that the hot/cold cycle "shock" will help release any gas molecules that may be right at the surface. Even if it is mythology, it seemed the kind that's relatively harmless when translated to superstitious action. ;-)

Thanks for your comments on the heater supply. I'll chew on that a while and see if any implementation ideas come up.

73,
Jim Barber, N7CXI

I'd test them with a couple of suitable signal generators, and a simple
filter on the mixer output. You should see if they are are still
working and get a feel for their performance.

This circuit doesn't look very good from any standpoint other than (possibly) being cheap. It's questionable for a crystal oscillator in anything but el-cheapo consumer electronics, and just bad for a coil & cap oscillator. Most of the points have been mentioned already; I'll just reiterate them with my own spin:

The base biasing is _wrong_. Biasing a bipolar transistor that way will make it extremely sensitive to device and temperature variations. You can somewhat get away with it in an oscillator because you're working with a class C device, so the emitter voltage will rise with rising oscillation strength, making sort of a poor-man's AGC (with emphasis on the 'poor').

Bias should be with a resistive divider on the base, adjusted so that the oscillator starts up nicely yet keeps the emitter voltage from rising to within 1 volt or so of the collector voltage.

The ratio of C1 and C2 is also extreme. I'm surprised that you get oscillation at all. The rule of thumb for a Colpitts is to choose feedback caps with reactances at frequency of around 150 ohms. You can improve the waveform (and load the circuit less) by retaining the 1nF "C2", increasing the capacitive reactance to the emitter with a smaller cap in series to the transistor emitter, and retaining the take-off point at the hot end of C2.

I wouldn't build an oscillator like this without following it with at least one buffer stage designed to minimize the effect of following circuits on the oscillator, and following _that_ with an amplifier stage. You're not building tube equipment, transistors don't cost that much -- go ahead and use a few!

If you don't get a book dedicated to RF circuit design (like Hayward's "Experimental Methods") then at least get a copy of the ARRL handbook and follow the guidelines there. You can go wrong with them, but not too much.

Thanks Tim,

>The base biasing is _wrong_.
I tried Jim's voltage divider biasing arrangement, it didn't help the waveform, but I understand
the temperature sensitivity of the original.

>The ratio of C1 and C2 is also extreme.
This circuit and all values was taken from Joseph Carr's "Secrets of RF Design"

I did replace the crystal with the LC. He calls this a 1 to 20 Mhz crystal
osc.

>You can improve the waveform (and load the circuit less) by retaining the
>1nF "C2", increasing the capacitive reactance to the emitter with a smaller
>cap in series to the transistor emitter, and retaining the take-off point
>at the hot end of C2.

Sorry, I don't know if I understand what you suggest; Do you mean to say
connect
a small cap from the connection point of C1 and C2 and the connection point
of the
emitter and R2?

I have seen several Colpitts osc. that have an inductor in series with the
emitter resistor,
would that be useful? If so what value for 3 to 6 Mhz.

On another note; I noticed the base waveform is pretty good. Has anyone
seen a design that
lightly couples a signal from the base to maybe a FET and buffers it. Just a
thought!

Thanks,
Mike

Thank you for your answer;

I was at Cohen's but unfortunately they did not have any.

The collector waveform will always be much richer in harmonics than the base waveform. If you want to multiply up this is Good. If you see some random circuit in a handbook keep in mind that they may very well have intended it to be used for multiplying up 2x, 3x, 4x, etc. so the bias etc. may have been chosen just to make the waveform at the collector look un-sine-ish!

There are numerous oscillators that take the output signal from a tapped-down tank if they want a minimum of harmonic content. Tapping down helps minimize the effect of loading on the tank Q, but taking the signal from there will have at least some effect on oscillator stability. Another place that might like look slightly nicer from a waveform view (and may be lower impedance) is the emitter. And there exists oscillators that put a smallish resistor in series with the tank - the resistor value is chosen small to not degrade the tank Q very much, and the small voltage across the resistor looks very sine-wavish.

Tim.

Yeah, and $3 a month here and $5 a month there for stuff that wildblue ought to provide along with their $50 a month satellite service.

Nice products. I still have a couple of your VOR testers that I mainly
used to verify my radios worked before departing the Bahamas on an
international IFR flight plan. After the plane had set a couple of
weeks it was nice to know the Navs were working before getting
```

airborne.

I probably ought to EBAY them. I have not used either for over 20
years and will have no use in the future!

You might check www.nogaqrp.org and look at "Kits" and the NoGaWaTT.
It can be built for the 0-6 Watt range, or milliWatts. It is pretty
accurate.

Also, if you are an ARRL member, go to the ARRL site and look for the
article on the log power meter. Near the end of the article, there is
information on an accessory higher power attenuator good for up to 100
Watts that you may be able to adapt to output to a 0-5 Watt range
meter (rather than the much lower power range of the log power meter,
a test instrument which only reads to about 5 milliWatts, or 7 dBm).

> I duplicated a circuit for someone because they got a bad
> output waveform.
> As I shift up in freq at about 2.7Mhz the voltages jump.

If the voltages suddenly jump with frequency change then this is a sign of instability. Not seen the circus digramus confusicus, but if it is a colpits then reduce the gain by adjusting the ratio of the two divider capacitors. I assume, of course, that you have adequately decoupled the supply line, and that there is no inductive coupling/feedback.

Instability causes eratic frequency and/or severe distortion. In particularly bad conditions it can cause unwanted visitors (CBers, neighbours, DTI, etc.).

Hi,
 I'm interested in buying a collection of QEX magazines.
I'd like to go back about 10 years, but any years is better than none.
If you have QEX your willing to sell please contact me offline.

Mike

Let me suggest the ARRL publications CD.  You get QST, QEX and NCD.  I like
them because I can then toss the paper QST copies, saving space, but better
yet, you can print out the schematics, PCB layouts, etc, mark them up, cut
them up, without guilt.  The recent years are all PDF so you can sut the
parts lists and paste them into a spreadsheet as you go collecting parts,
pick out tables of interest and concentrate them into a reference binder,
etc.

..

Guys,

The Sony XR-5100 in car cassette AM/FM/SW radio is a great little performer, and its mounted in my Pajero 4x4. I ordered my from the Shortwave Store and picked it up when I was in Hawaii for my Wedding and Honey Money 2 year ago (Else delivery cost to Australia was not going to be worth it). Whenever I head out camping or just day trip I always have a Shortwave Radio with me, without worrying about packing a portable shortwave.

The only downside is the radio beeps when you press the tunning buttons. So If you know what freq you want then you hold the tuning button until you get there else you let it scan and stop on freq whichever you desire. BTW it does have a remote control which I love as when I'm sitting on the back tail gate / boot I can easy control the radio and volume from back there :)

To make it more effective I carry two bits of random wire BLUEY 1 - 10foot blue light wire cable for short stops by the side of the road and BLUEY 2 - a 100m drum of light wire cable for when I have time to run a good bit of length.

I would highly recommend this radio, but if you can unlike mine do not run it though a electric car antenna, however that said, when the car is stationary and engine turned off the electric antenna is fine, and even better when extended with a bit of wire :)

Regards
Mark

Location: Canberra Australia
Radio: Icom R75 with DSP options
Antenna: Cliff Dweller 2

Damm!  I dumped a few years worth, when I bought the ARRL CD. Now I
keep up by buying the annual CD from ARRL, in each Feb, or
thereabouts. It has QEX, QST and NCJ on it.

The CQ one is also pretty good, even although it has some articles
withheld because of copyright arguments, mainly fractal antennas.

I still have most issues (maybe all). But shipping them to someone, even
to the state next door,
would probably be too costly. They will probably go into a dumpster some
day.

Despite an orchestrated campaign of attempted censorship by UK-resident newsgroup
readers, TFN did not bow
to demands for a suppression of freedom of speech. TFN general policy on the
matter is as follows;

Draft Policy on Account Deactivations due to News Group Postings
==

News group postings occasionally take the form of a message which goes against the
"topic" of the conference.

For example, a derogatory message about Canadians in the soc.culture.canada.

Members of such news groups then may send a message to the system administrators asking that a user's account
be terminated because of such posting.

The Toronto Free-Net Board of Directors has taken the position that the only postings that will get a person's
account terminated is material that is illegal under Canadian law. Otherwise, the Toronto Free-Net will not
take any action.

Freenet Executive Director Mike Anderson had this to say regarding the continued attempts of a minority of usenet
participants to have my account on his system deactivated;

The TFN's policy is not to take action against members unless they contravene the Criminal Code of Canada, or
engage in practices such as forgery, attacks against other computer systems or mailbombing.

Mr. Corley, while possibly being very annoying, has not contravened the TFN's policies. The TFN believes strongly
in freedom of expression, while recognizing that the price for such freedom may be a high signal-to-noise ratio in Usenet.

If Mr. Corley breaks the law, we will take action -- until then, he has the same rights as any TFN member to post
to Usenet newsgroups. Actions such as mailbombing the TFN in protest will be met by strong complaints to the
originating site's postmaster. The best defense against unwanted postings may be simply be to ignore them and deny
the poster an audience.

TFN Executive Director Toronto, Ont CANADA

Personally, I find it gratifying that my contributions to usenet discussion are recognized as being conducive
to a high signal-to-noise ratio by their quality and thoughtfulness.

Remember the two-way televisions in George Orwell's 1984?
The ones which watched you back? Which you could never get
rid of, only the sound could be turned down?

Well the country which brought Orwell into the world has
made his nightmare follow into the world after him.
Since 1990 the British have been waging war against one of
their own citizens using surveillance to invade privacy
and a campaign of abuse in the transmitted media in
their efforts to humiliate their "victim".

And the most remarkable thing about it is that what they
do is not even illegal - the UK has no laws to protect
the privacy of its citizens, nor does it proscribe
harassment or abuse except in the case of racial abuse.

A lot of people in England know this to be going on,
yet so far they have maintained perfect "omerta";
not a sound, not a squeak has escaped into the English
press, and for all the covert harassment absolutely
nothing has come out into the public domain.

Have the British gone mad? I think we should be told.

Mmmm.

Who, exactly is this victim you're talking about?

First up, Britain or the UK (not 'England' - England is
a part of Britain, like Kansas is a part of the USA) does
have laws that protect the individual from harassement -
you can't just threaten people willy nilly. There are laws
against that. And if someone lies about you in the press
or tv then you have recourse to libel/slander etc. laws.

True, Britain has no 'privacy' laws as such, but isn't that
a good thing? As of this moment, the govt. are considering
a privacy law, but it is unlikely to succeed. Why? Because any
such law would benefit the priviledged and those in power.
Privacy laws, while supposedly protecting the individual, help
those in power hide their mistakes/scandals. They stop the press
etc. investigating. Privacy laws are undemocratic - they prevent
the people from keeping an eye on govt.

And stop looking for some kinda conspiracy in the British
press. It's hardly perfect, but your notion that they don't
cover/campaign against press legislation, harrassment,
discrimination, human rights etc. is plain wrong. You've never
seen a British paper in yr life.

You clearly have a specific case/individual in mind. Speak up!
The thought police aren't coming round just yet.

Douglas.

Subject: Re: BBC's Hidden Shame

Confession time - the victim is/was me (except my name isn't

Corley, but that's irrelevant). What happened was not threats; just invasion of privacy, in a partiicularly flagrant and shocking way, in a way which most people would consider to constitute harassment.

You know there's a particular category of person with mental illness to whom TV and radio "talk", ie they feel the broadcast is directed at them in particular? This happpened to me, quite some time ago in the UK (I'm originally from London, so I've seen plenty of British media print and other). They invaded my home with their bugs, they repeated what I was saying in the privacy of my home, and they laughed that it was "so funny", that I was impotent and could not even communicate what was going on. Who did this? Our friends on BBC television, our friends in ITN, last but not least our friends in Capital Radio in London and on Radio 1.

How did they do this? I'll give you an example. About a year ago, I was listening to Chris Tarrant (Capital Radio DJ among other pursuits) on his radio morning show, when he said, talking about someone he didn't identify, "you know this bloke? he says we're trying to kill him. We should be done for attempted manslaughter" which mirrored something I had said a day or two before (I'm not paranoid, honest!). Now that got broadcast to the whole of London - if any recordings are kept of the shows then it'll be there.

You mean the category where they think that everyone is after them ? that
one ? So lets get this straight you know you are paranoid and you think
that they are out to get you ? Uh huh, try putting the two together and
see what you come up with.

>quite some time ago in the UK (I'm originally from London
>so I've seen plenty of British media print and other).
>They invaded my home with their bugs, they repeated what I

>Radio in London and on Radio 1.

Oh yeah, I can see it now. All of them banding together, in a united effort against one man. So ITN, the BBC, and Capital all decide to sit round the table and they come up with idea of breaking into someones house, putting bugs everywhere, listening in to his conversation, and shoving it out on the news everyday. This someone has nothing to do with politics, or business, or entertainment, just an ordinary Joe Bloggs who seems to be extremely paranoid.

Have some sense, grow up and smell reality. What you are talking about would take loads of planning, tens of thousands of pounds and lots of people involved in the planning, execution and maintenance of it. You must have a very high opinion of yourself to think you are worth it.

>How did they do this? I'll give you an example. About a year ago,
>I was listening to Chris Tarrant (Capital Radio DJ among other

Of course you are not paranoid, just slightly mad. Did you ever look for the bugs in your house ? If not, why not ? I mean if I thought that was happening to me, I'd search the place from top to bottom, I mean I live there I would know if anything was out of place. If I was really paranoid, whoops I mean suspicious, I would call in one of those bug detection teams which have those machines that pick up the transmitted radio waves. This reminds me of BUGS, that new programme on BBC1 on saturdays which is all about this kind of stuff, but, shown as a drama / thriller. I suppose thats based on you as well is it ?

>is that there is a conspiracy in Britain, that it encompasses the
>broadcast media, and there is no way of breaking the conspiracy.
>The people who are involved in it will not open up.

What a load of jolly hollyhocks, I would say something else but, apparently students are not allowed to swear on newsgroups in case it damages the reputation of the university or some such jolly hollyhocks.

This guy is extremely paranoid to suggest that the entire British media is after him in such a big way. He gives no real reason as to why they are after him, just that he suffers/suffered from a slight mental disorder, could it be paranoia perhaps ?? No surely not.

I put it to the house that he has never recovered from this mental disorder, lets come out with it and call it paranoia, and thinks everyone is after him. Remember just because you aren't paranoid, doesn't mean they aren't after you.

This guy has a serious problem to suggest that the media would go to such lengths just to single out and ridicule one person. I mean apart from anything else, we (the listening masses) wouldn't be interested unless it concerned the royal family, politicians or showbiz personalities. e.g. the camillagate tapes. I would think that almost everyone, no matter how much they went on about infringements of privacy read the transcripts with interest. I really don't think that Joe Bloggs ordinary guy or paranoid nutter would have the same appeal. Well actually I dunno. :)

Regards,

Paul.

That is what happens in big cities. Hell, it scared me to death when I first
started working in Manchester. People keep talking to me on the streets,
even if its just to say hello, and I've no idea who they are. This happens
to most people, don't worry about it.

>>paranoid, whoops I mean suspicious, I would call in one of those bug
>>detection teams which have those machines that pick up the transmitted

>That's exactly what we did. We went to a competent, professional detective
>agency in London, paid them over 400 quid to debug our house. They found

Doesn't this suggest to you that there are, in fact, no bugs to be found?

>Over Easter I went to the police in London, telling them basically
>what I've posted here. I don't think you'll be surprised to learn
>that I didn't get very far; they asked "why would they be doing this to
>you in particular?" and the answer "they are because they are" doesn't
>go very far.

Exactly. All you have offered so far as proof of your harrassment by these
people is:

1) Someone on radio said something that you had recently said

and

2) People on the streets seem to recognise you.

These are both perfectly normal occurences and happen to lots of people every
day so it is unsurprising that people here, and the police, are not taking
you seriously.

Trying to always keep an open mind about things I would say that one of three
things is likely.

Either there is a lot more to this that you are not telling us, or you are messing about or you have some genuine delusions. I'd like to think that in two of the three cases you would find some real support here, but it seems unlikely I'm afraid.

Claire

The key is the pattern, or a change in the pattern. I've lived in London almost all my life, and just walking around the streets, I never got hassled by anybody. All of a sudden, people start harassing you, throwing abuse at you, behaving as if they know you personally, as if they've seen you before somewhere. I read in the papers that this happens to Colin Stagg and people like that Eastenders actress, but they've had their picture in the paperes, so that is understandable. In a couple of cases people have even known my name - when I was in London over Easter I was walking down Shaftesbury avenue in the West End when somebody (no idea who they were, just some bloke with his girlfriend) called me by name - quite clearly, and my name is distinctive. This also happened once about four 1/2 years ago, onn the tube - some blokes I had never seen started chanting my name and a term of abuse.

It's the pattern which convinces me there's something to it - and would convince any impartial absever who could see things tyhrough my eyes.

>Doesn't this suggest to you that there are, in fact, no bugs to be found?

There's a little story behjjind this. First iof all, in 1992 I worked for a company where the people made clear they knew what was going on, first of all directly (the very first evening I was there I went out to the pub with them and the Technical Directpor said to another guy, "is this the bloke who's been on TV?" "yeah, I think so") and also

indirectly, by rep[peating stuff I was saying at home in London and
in my rented accomodation there (I moved several times in the course of
1992 and they followed me each time). Now, if "they" (the buggers)
knew their bugs could be found easily, they wouldn;'t be keen to make
their existence known, would they?

Also, in summer 1992 I went on a trip abroad to Europe by coach, and
on the way out there were a couple a little younger than myself on the coach
a bloke and hius girlfriend. He said things about some bloke who was
never named, who sounded exactly like me - and he made explicitly
clear that our house was bugged, and that a neighrbours house was
bugged (and at work they'd been rep[earting what was said at the
neighbours, so this looks like independent corroboration).
They also said stuff like "at school he was always really streesed,
they found someone from his school and he was a real psycho"
and that "he was in a B&B for one night and they got him", dead right
again, I had been in B&B for once night a few days before this trip
and weatching the news again got a reaction from the newsreader.

>:some pirate radio station in London in 1991, started listening to
>
>Conclusive proof if ever I heard it.
>
>Of course you were the only person in the office in the whole of Britain

Yeah, but this is the point. Each incident is easily and automatically deniable along the lines you're taking. But when this happens every time, and when you get independent corroboration from other people, then there's no escaping it. For example, immediately after I lost my job in 91 I went into the local garage to get some work done on the car, and one of the blokes there said to the other, "so what do you think of it then? it's getting killed on the radio isn't it"
Now again, you look at that and no proff; you can ask them what they're referring to and they can say they're talking about something else.

>I know you may be a little paranoid, but I suggest you sit down
>and work out rationally what possible reason anyone off television,
>or radio would have for listening to your conversations. After all
>it must be hard enough to present a show to millions of people
>without the added burden of watching and listening to a single
>person and slipping their phrases into the programme.

These presenters are clever people. They wouldn't be presenters if they weren't - they're easily capable of reacting to an individual in this way.

What possible reason? I guess because they think it's amusing to do so. They know that if you ever tell anybody, without being able to show any evidence, then the reaction you'll get from just about anybody will be the one you're showing now.

I realize there are loads of people in England and elsewhere with the sort of thoughts I've described in these postings; and almost all impartial observers would say that nothing other than an
go after their private conversations (if they did it to me then I can do it to them, it's a questions of technical competence and money). If you were lucky, you might be able to entrap them into admission. You could of course harass or threaten them back (any coppers reading this?) but that would be illegal and might get a result quite different to the one you're trying to achieve. Of course, it might come out of its own accord given time - if so many people know, if they have an escape valve in their "subtext" through the media, will it not cease to be at a covert level, given time? Surely it is in my interest for it to become overt, since the transgressions at this time are on their side and not on mine?

Thoughts? There must be some way of breaking the secrecy. This isn't the first time in human history that a conspiracy has taken place on this scale, but the truth tends to out. The situation now is they think they';re "winning" hence have little stimulus to change the rules - if they started seeing themselves "losing" things could change drastically.

Mike, if that is your name,

I'm going to try to rationalise what you're telling us. I can think of three possible explanations for what you are experiencing.

One is that there _is_ a conspiracy against you. As a previous writer said, though, a lot of these programmes are taped, so it really isn't possible in some of the cases you've named. Further, why were no bugs found in your house? Finally, unless you are a political figure or someone else in the public eye, why would anyone bother? People like me (and I assume you) are small fry; our contribution to society is likely to be minor. Why would anyone spend so much money and effort on you?

Another possibility is that you are developing some kind of paranoia. There's no stigma attached to this; we're all paranoid to some extent, although perhaps not to the extent that a doctor would call us paranoid. I think paranoia is quite a straightforward explanation here - you really do believe that all these things are aimed at you; you see people everywhere trying to get at you. Logic suggests that this cannot really be the case.

The third possibility is that not even you really believe any of this, and that this is a "troll". I'm not sure I believe this possibility, but it's possible.

Anyway, if you want to be sure that you're _not_ going mad, I'd go and see your G.P. if I were you. If you don't trust him/her, why not see someone recommended by a person you can trust? If you don't trust anyone any more, don't you think it's time you got help?

Alan

For a troll, the posts are remarkably well-informed on paranoid behaviour.. you'd need to be one, or be reasonably well-informed on the subject to sustain the tale... which lead me to my theory...*ahem*...:

An extension to possibility 3 (Number 3.5, perhaps?) is that the original poster may be somehting like a psychology student writing a term paper on the net community's reactions to this tale. (Now, there's paranoia for you! Not only are they listening to/watching us, they're writing reports about us too...:-)

More likely, though, is that the poster is genuinely in need of professional help (he has intimated as much, himself) and, as such, he should be encouraged to seek it.

regards,
IanP

>OK, so instead of my posting the same tedious stuff every day,
>why don't you actually read the contents, and make a meaningful
>reply? Something more constructive than those silly little
>jokes about paranoia perhaps? Like what objectively can you do
>to break the conspiracy open, if one exists :-) ? If somebody
>did it to you, what would you do?

But we've *done* that. I certainly have at least. Way back when you originally started posting and your posts were neither tediously repetitve nor stupidly long.

But whenever anyone makes any good suggestions you ignore them and start posting from the begining again. You don't want us to help you - so what do you want? If you really wanted help you would listen to peoples suggestions and respond to them. Is this just an attention thing?
But I'll try again, because I'm a fool like that.

>o   Tell people about it, go to the police / legal services
>   Done that; those around me either don't believe me, or they
>"sort of" believe but can't do anything about it. As for going
>to the police; I did, over Easter. Discouraging. They must be
>familiar with the occasional person walking into a station with
>this sort of story. "If a psychiatrist says you're imagining
>it, then that's what it is".

You haven't yet given any examples of anything concrete to suggest that this is really happening to you. This, I would imagine, will be the stumbling block for the police. How can they possibly help you when your only evidence is a jumbled mess of TV presenters saying things that could be construed as answers to your comments and the 'feeling' that people are talking about you and watching you?

I seem to recall that last time this was being discussed someone asked if you had been to see a psychiatrist about this - after all if this is really happening then you have can only benefit from being given a clean bill of health. I don't recall an answer.

>   I also went to a firm of solicitors; again, very discouraging. Put bluntly, they can't deal with cases where the perpetrators aren't well-defined and the existence of the crime itself is unprovable.

Well how could they? Who would you sue? The country?

>o   so if that option is out, what's left? well, there's the "do nothing" option. To some extent this option works. They've spent a lot of money and ultimately achieved nothing except to force me out of the country - which has been an own goal for them, since now they can't do what they were doing in the UK. Expenditure of further resources would feed the pockets of their greedy contractors, but is a waste of money as far as the employing organization is concerned.

So you are no longer in the uk? And this is not happening anymore?

Then let it go. Just leave it alone and get on with your life. Its just not worth it. There is nothing you can do to prove that this happened whether it did or did not. So forget it. Go and explore the net - when people aren't spamming it with useless repetitve posts there's a lot of interesting and worthwhile things out there to see and do. Likewise real life (I'm told *&).

>completely conventional, I have a good academic and work record. Until all this started, I had no mental health problems; the diagnosis of illness was only after 2 1/2 years of abuse. If they did this to me, they could do this to absolutely any British citizen. If this stuff gets out, it won't be me that has to worry - it'll be them. They take a normal person, lie about him, demonise him, try to force him into killing himself - and this is in a country where the rule of law applies?

If this gets out then *that* will be the time to bring your claims to the foreground.

The only thing ruining your life right now is you, Mike. And the only thing that will make your life any better now is also you. So go and make your life better and show them that they failed.

Claire

```

>But we've *done* that. I certainly have at least. Way back when you
>originally started posting and your posts were neither tediously repetitve
>nor stupidly long.

Once again we're running into a brick wall. The reason I started posting was because I couldn't figure out a way out of the situation, and thought that saying it out into the open would provide a catalyst for one of those "in the know" (there are plenty in this category, and it's a fair bet that some of them are reading this) to speak up.

It hasn't worked, yet. A little more aggressive shit-stirring (excuse expletive) might do the trick. Perhaps Usenet posting is the wrong arena for this sort of activity; although obviously it does have the advantage of rapid feedback.

Thing is, for people to open up, you would have to provide them with a reason why it would be in their interest to do so. There's no obvious way of doing that; to get thinking people to incriminate themselves when they're safe in denying all knowledge is not a trick I can figure out how to do.

>But whenever anyone makes any good suggestions you ignore them and start
>posting from the begining again. You don't want us to help you - so what do
>you want? If you really wanted help you would listen to peoples suggestions
>and respond to them. Is this just an attention thing?
>But I'll try again, because I'm a fool like that.

A "good" suggestion would be one which had the effect of halting the persecution, which so far hasn't happened. If you make a "good" suggestion then damn right I'll stop posting - because then I won't have to.

>You haven't yet given any examples of anything concrete to suggest that this
>is really happening to you. This, I would imagine, will be the stumbling
>block for the police. How can they possibly help you when your only evidence
>is a jumbled mess of TV presenters saying things that could be construed as
>answers to your comments and the 'feeling' that people are talking about you
>and watching you?

Because, as said previously, concrete proof does not exist. If it existed then I wouldn't be talking to you - if it could be proved, or if those doing it could be found, they wouldn't be able to continue.

What's happened is all conversation. You can't prove conversation, not without a tape recorder, and even then you would have to prove that what they meant corresponded to what you understood.

The psychopath who manages the Applics group at my previous employers played little word games, not only with me but with at least one other person in the group; words which rhyme with swear words, words which are ambiguous, eg "bent", words which rhyme with wank, "sheet" rhymes with shit, end (how was your weak end? being the standard salutation on a Monday morning). Sounds childish, most people would easily tell him to fuck off; except to people with predisposition to depression and the inability to express themselves (this was before I started taking medication), that sort of nastiness is not bearable. After ten months of this I was so ill I was crying constantly, eventually I went into hospital and started on medication. Somebody else he did this to (over a year later!) got so depressed he took an overdose of pills, had to go on antidepressants and left.

And where does the "concrete proof" of this trouble exist? NOWHERE. Even if you had physical evidence, even if you had the presence of mind to record what was said, how could you prove what he actually meant by what he was saying? In some cases of harassment you can prove what was done, because it's undeniable. But when the harassment is done with any presence of mind whatsoever, it becomes difficult. In the case of the wider harassment, the people doing it obviously know what they're about - they must have done similar things to other people before in one form or another, and they know what they can get away with, they know what the police will do nothing about.

>I seem to recall that last time this was being discussed someone asked if you
>had been to see a psychiatrist about this - after all if this is really
>happening then you have can only benefit from being given a clean bill of
>health. I don't recall an answer.

Yes. The reply was of the "neither confirm nor deny" variety. Not much else they can say, is there?

>Well how could they? Who would you sue? The country?

Hmmm, now there's a thought... :-)

>If this gets out then *that* will be the time to bring your claims to the
>foreground.

Wrong way round. It won't get out unless I do something to bring that about; remember, it isn't in THEIR interest for THEIR criminality to be exposed. Yelling loudly on Usenet might nudge things along in the right direction.

>The only thing ruining your life right now is you, Mike. And the only thing
>that will make your life any better now is also you. So go and make your
>life better and show them that they failed.

Ignoring them would be bliss, but it's not a winning strategy.

There are going to be more of these posts. Sorry. That's the way it is.

>Very unstructured, no proof whatsoever. So why should anyone
>take it seriously? If I said to you, "my next door neighbour eats
>babies", how much credibility would you attach to that?

Well, cos it's true. I was hoping that someone "in the know" would
appear and make some self-revealing comments, but that hasn't
happened. Everyone's keeping quiet. What a pity.

>>This is an agglomeration of articles and replies previously
>>posted to Usenet, so it's a bit hard to read. This posting
>>describes a campaign of character assassination initiated

>Who's character is being assassinated? It isn't clear from the post.
>Are we talking about Grenville Janner? I thought he was a spook
>himself? He's certainly able to hold his own on the issue you cite.

Mine, mainly. The reason for putting that episode at the top
of the posting is that they tried to kill two birds with one stone
at the Beck trial - they simultaneously put words into the mouth

of their invented "witness" to smear Janner, and repeated exactly, word-for-word, stuff which had been said by and about me.

That was the only occasion (the only one recognizable to me, anyway) when they went after another target at the same time. And it's quite lucky they did that - because it could give some pointers to who they might be.

Presumably there are people still around who were involved in that trial, and know what happened. Beck might be dead, but the "witness" would still be around, as would Beck's solicitor.

>>by a group of people or agency within the UK. Although
>>they have never presented their identity, you can draw
>>your own conclusions on that point. There aren't many
>>people with the technical resources and contacts in
>>society to make feasible the sort of deliberate attack
>>on an individual which is described in this article.
>
>There aren't _any_ as far as I am aware.

I'm afraid there are.

>>The most disturbing part of the whole episode is the
>>participation of British institutions and their members, fully
>>comprehending what they do, in what is an act of attempted
>>murder against a British citizen.
>
>The whole society, in fact. From the top to the bottom. They
>wouldn't be trying to tell you to kill yourself by any chance,
>would they?

You got it. I'm a popular guy.

>>After the trial Janner said that "now he knew what it felt like
>>to be a victim of Beck's"; but, it wasn't Beck who set up the
>>attempted character assassination on Janner; the fact that they
>>took a side-swipe with their verbatim repetition shows
>>where the real source is to be found.
>
>The newspapers?

Well, your guess is as good as mine. But what newspaper would send a team after someone for five years? I don't think so, somehow. Of course they could, but it wouldn't be in their commercial interest.

You'd have to look at a corporate entity which would indulge in activity of this type, and the nature of the contacts they have narrows down the search.

>>The goons behind the molestation are lower than the paedophiles
>>they use to convey their propaganda - they use the same

>>strategy of covert abuse, but there is nobody to check their
>>actions, or to bring these criminals to justice.
>
>Ummm.. Janner is a Barrister, a journalist who writes on a wide
>variety of issues, and a long-standing Labour MP. If he's unjustly
>smeared, he's more that capable of setting the record straight.

Janner blamed Beck for the invention. He didn't say anything about
it having any other origin. Even had he suspected any other source,
he could hardly have pointed the finger without some evidence.

>You say that the media is making similar allegations about you in
>relation to this issue? So, you're accused of child abuse, amd
>the allegation was reported in the media, I assume.

I've been accused of many things although that wasn't one of them.
Most of them have been yelled in my face by people on the street
in London at some time or other. Bit difficult to misinterpret
when that happens.

>What exact;y are they saying about you? (Respond here please. I'm
>leaving the UK tomorrow, so I can't read e-mail.)

It changes with time. Every so often, they sing a new song;
so at one point the allegation was homosexuality, at another
is was low intelligence, then it degenerated into sexual abuse.

<snip>

>>They invaded my home with their bugs, they repeated what I
>>was saying in the privacy of my home, and they laughed that it
>>was "so funny", that I was impotent and could not even communicate
>>what was going on. Who did this? Our friends on BBC television,
>>our friends in ITN, last but not least our friends in Capital
>>Radio in London and on Radio 1.
>
>How do you know this? Just from what you hear on the radio?

I can't remember if this was mentioned in the "regular" posting,
but on a few occasions they set me up with people nearby to talk
about me, or more correctly, to talk about somebody who
(in their minds) "resembles" me, with actually naming me.

One such occasion was a coach trip to Europe in June 1992.
The "set up" comprised a guy talking to a vacant giggling female
about "this bloke", who was never named. Apparently "they"
(also never named) "found somebody from his school",
"they" "got" him at his house and at a neighbours, and at
a B&B where their target was for one night.

Apart from that, yeah, from "what I hear on the radio". And
from what I see on TV. (I wouldn't be doing my job as a
mentally ill person properly if the TV and radio weren't

talking to me, now, would I?)

>>Oh yeah, I can see it now. All of them banding together, in a united
>>effort against one man. So ITN, the BBC, and Capital all decide to sit
>>round the table and they come up with idea of breaking into someones
>>house, putting bugs everywhere, listening in to his conversation, and
>>shoving it out on the news everyday.
>
>But why would they do this? What possible reason would they have?

But why get at anybody? Victimisation is the pastime practised against
other people; as the scorpion said to the frog, "it's in my nature".

>Are you aware that what you describe is also a common symptom of people
>who are suffering from a psychiatric illness? Have you been to your
>doctor and told him about this? Did he prescribe any medication? Have
>you been taking it, or have you stopped?

Yes, Yes, and Yes respectively. Still taking it. Doing quite well actually.

>>This someone has nothing to do with
>>politics, or business, or entertainment, just an ordinary Joe Bloggs who
>>seems to be extremely paranoid.
>
>Usually a clinical symptom rather than proof of a conspiracy in such
>matters.

>>How did they do this? I'll give you an example. About a year ago,
>>I was listening to Chris Tarrant (Capital Radio DJ among other
>>pursuits) on his radio morning show, when he said, talking about
>>someone he didn't identify, "you know this bloke? he says we're
>>trying to kill him. We should be done for attempted manslaughter"
>>which mirrored something I had said a day or two before.
>>Now that got broadcast to the whole of London - if any recordings
>>are kept of the shows then it'll be there.
>
>And this is supposed to mean... what? Chris Tarrant is in on this plot
>to kill you? It sure sounds like a joke to me. When you start to get
>ill, the mind often makes connections that seem logical and lucid to
>you, but do not to the rest of the world. This is one of those connections.
>They are usually known as delusions.

This is the problem, and there doesn't seem to be any way around it.
If a clearly sane person reported this persecution, you might believe
him, but probably you'd tell him to go see a doctor to "verify his
sanity". If someone with the illness of which you could argue these
things to be symptomatic says these things, again, you might believe
him, but it would be unlikely - the easiest route is the one you are
taking in the above paragraph. The only way I can convince you of what
I am saying is by giving precise details of what, when, how - and for
most of that stuff is based solely on memory.

To prove it would require an admission from somebody, or else hard

proof in the shape of physical evidence such as tape recordings.
Of course, I don't have that.

>The idea of a "pattern", and the notion that if anyone could look
>through your eyes they would see the same thing is very indicative of
>the onset of a psychiatric illness. Schizophrenia and manic depression
>have similar symptoms. I'm not trying to be disrespectful here.
>This may be an illness and it can be managed by the use of medication.
>If it _isn't_ treated, it can lead to terrible tragic consequences.

I'm quite aware what the symptoms would be, and that the reality
corresponds to those symptoms.

But if anything, that is an argument which could convince you of
the truth of what I'm saying. If they deliberately set out to
simulate the symptoms of schizophrenia - in other words, if they
know through observation that their target is either suffering
from the illness, or is on the borderline and could be pushed in
with an appropriate stimulus, then they can feel safe in what
they do, since once you are registered as suffering from the
illness, people will assign less credibility to assertions that
persecution is based in reality.

That this can happen, and people collude by silence, is absolutely
horrifying. It is all the more horrifying that it can happen in a
country such as Britain which has no history of repression.
Perhaps its happening in the UK is due to the arrogant assumption
of moral superiority on the part of those in the media and others
involved - we won the last war and we can keep harping on about
German and Japanese war crimes, so we can do whatever we like and
we'll be right, up to and including destroying the lives of our
citizens (as long as we're not caught doing it).

>>That is the level it's at - basically they show they're listening
>>to what you're saying at home, they show they're listening to you
>>listening to them
>
>But why? And why you? Do you realize how much it would cost to keep
>one person under continuous surveillance for five years? Think about
>all the man/hours. Say they _just_ allocated a two man team and a
>supervisor. OK., Supervisor's salary, say, �30,000 a year. Two men,
>�20,000 a year each. But they'd need to work in shifts -- so it would
>be six men at �20,000 (which with on-costs would work out at more like
>�30,000 to the employer.)
>
>So, we're talking �30,000 x 6. �180,000. plus say, �40,000 for the
>supervisor. �220,000. Then you've got the hardware involved. And
>any transcription that needs doing. You don't think the 'Big Boss'
>would listen to hours and hours of tapes, do you.
>
>So, all in all, you couldn't actually do the job for much less than
>a quarter million a year. Over five years. What are you doing that makes
>it worth the while of the state to spend over one and a quarter million

>on you?

Those are pretty much the sort of calculations that went through my head once I stopped to consider what it must be costing them to run this little operation.

The partial answer is, there have been periods when the intensity has been greater, and times when little has happened. In fact, for much of 1993 and the first half of 1994, very little happened. Although I don't think that was for reasons of money - if they can tap into the taxpayer they're not going to be short of resources, are they?

The more complete answer is in the enormity of what they're doing. When countries kill their own people, as a rule, they get found out and all hell breaks loose. This isn't some para shooting Irish teenagers in the back. This is something which permeates English society, which they are ALL responsible for, and which they cannot escape responsibility for.

Relative to the cost to British pride of seeing their country humiliated for the persecution of their own defenceless citizens, isn't is worth the cost of four or five people to try to bring things to a close in the manner they would wish? To the government a million or two is quite honestly nothing - if they can convince themselves of the necessity of what they're doing, money is not going to be the limiting factor.

>>What possible reason? I guess because they think it's amusing to do
>>so.
>
>What? Spend a quarter mil. a year to amuse themselves? And why not
>change every now and again? Why keep watching you? (Unless you _are_
>doing something, and I don't think you are, though you may have some
>deep, dark secret in your past.)

See the above.

===

>>I'm going to try to rationalise what you're telling us. I can think of three
>>possible explanations for what you are experiencing.

>>Another possibility is that you are developing some kind of paranoia. There's
>>no stigma attached to this; we're all paranoid to some extent, although
>>perhaps not to the extent that a doctor would call us paranoid. I think
>>paranoia is quite a straightforward explanation here - you really do believe
>>that all these things are aimed at you; you see people everywhere trying to
>>get at you. Logic suggests that this cannot really be the case.

>I think the evidence leans towards this explanation myself. Why not
>try soc.support.depression and see what some of the people there have
>to say about this? Just to get some more perspective on your perspective,
>so to speak?

Sure, it "leans" towards it. But please at least admit there is a POSSIBILITY of it being very real. And once you've done that, can you come up with some thoughts on methods of proof? I may be missing something in my assessment - there may be a way of proving it, in the face of non-cooperation from the "players".

>Hmmm, strange eh.
>I mentioned all this goings on to my boyfriend, who works for the
>British intelligence service, and he assures me this sort of thing
>never goes on.. not ever...honest.

>Though he said the name was familiar...

it does go on, although it's an open question who does it.

Some time ago there were press reports of an Army intelligence person called Jones who claimed Diana and Hewitt had been photographed in a compromising position... he said he'd been doing this as part of an Army unit which had previously operated in Northern Ireland.

Then Hewitt said he'd been told the same thing by some Army people, and that they were threatening to release the tapes unless they curtailed their liaison... as per usual everyone denied everything, painted Jones as the "Jones twins" - not very original in how they deal with their perceived enemies, are they?

You have to wonder how they manage to achieve this sort of surveillance though. Audio you can understand, it's possible to put a microphone through the wall, and apparently there exist devices which will retrieve sound from a laser beam bounced off a window - sounds sci-fi, but there's a well known surveillance electronics company in London which sells these things.

But how would you get video out of a room, unless you had actual physical access in order to plant a device for pickup? We're not talking about looking in from afar, but an actual device within the room. You could either drill through the wall and shove a pickup through; or you could supply a trojan device with a hidden pickup inside; but most likely, you would have to physically break into your target room to plant a camera. That's not an infeasible option; all it means is having your target(s) watched to make sure they're not in the vicinity, then you negotiate any locks on the property and find a suitable receptacle for your device.

The next question is how they defeat the usual methods of counter-surveillance. We had private detectives carry out a "sweep" of every room and the telephone line. They found nothing. That indicates at least four possibilities that I can think of; (this is all guesswork BTW, and probably fanciful guesswork at that!)

1) no bugs (pull the other one)

2) radio-transmitting devices which can be controlled from an external source, ie you can instruct them to switch off when you detect a counter-surveillance sweep taking place

3) hard-wired devices; probe microphones or whatever they're called, things you poke through the wall

4) passive surveillance devices; so you bounce laser or radio waves off a suitable reflecting surface (again, sounds far-fetched but such things may apparently exist).

5) there is a fifth possibility, that the PI's didn't detect
an actual transmitting device; there are technologies
specifically designed to avoid detection, eg frequency hopping
and suchlike. But how much sophistication could you build in
to a device which would have to be small enough to be
physically concealable?

I guess the real question is to find out who is ultimately behind these "goings on". And if the "great and good" (or the better known, at any rate) can't protect themselves, what hope is there for the rest of us?

Andy writes

Does anyone know where I can get a (free) schematic of a Kenwood ST-1 base station which is built to hold a TR2400 handi talkie....???

It contains a charger for the TR2400 and I'd like to have a copy of the schematic lying around in case it stops working someday..

Thanks in advance for any good advice,

Andy W4OAH in Eureka, Texas

All,

I have a situation, and would like some opinions rather than flames on how to handle it.   My wife teaches at a public school just off the Easter Arizona Navajo reservation.   Lately, a junior school science teacher is starting up a science club and has asked me to provide for the amateur radio side of the club and be its control operator.

She believes that the kids would be fascinated by the Morse code - Dxing - Construction end of the hobby, even though Morse is no longer a required test element.

The kids are mostly Navajo and thusly have a very limited technological background (hence the reason for the club to stir the interest), so I need something concrete with immediate payoff to keep their interest hooked while getting them as ready as I can to write their Technician exam. The nearest VEC is 4 hours away and I'd rather have as few fail as possible.

I had thought to start an unlicensed micro-power code practice net whose range would be limited to about a 30 mile radius, which is about the size of the local reservation right next to the school.

What I want to do is provide each kid with a popcorn CW transceiver for the colorburst frequency (3579 khz), a key, a short random wire, and a battery. That way they could practice amongst themselves with myself as occasional net control.

My question is this: so long as final output to the antenna is within the requirement of part 15 unlicensed operation, is part 15 unlicensed operation allowed within a band normally governed under part 97?
Part 15 operation would easily cover a 30 mile radius on 80M.

If no, I'll run the net under part 15 on the edge of the AM band near 160M.

Thanks in advance,

The Eternal Squire

Wouldn't it be easier to just read part 15 rather than starting what
is bound to be a major flame war between the barracks lawyers?

[much snippage]...

I won't flame you at all -- I admire your elmering, and think it's a great idea.

I'd be exteremely careful to make sure you meet the field-strength requirements of Part-15 with whatever project you do -- it can be remarkably easy to get foul of it and reliable measurements require skill.

Besides 80m and the top of the AM ex-band you might also consider the lowfer 1750m stuff ... Lots of kits out there for it, and an active user community.

Of course getting them all licensed would be the best solutiuon ...

Junior high is probably just at the edge of where passing the novice or tech written would be a cake-walk. As I used to joke to my classes, "there's three parts to the written -- three engineering formulae: E=IR ; c = f lambda ; 40inches in a meter., a handful of common sense questions, and a few memorizable factoids" (band edges, etc.)

I had a sixth grader of average intelligence in one class - it was a little harder for her, but she passed it on her second try.

I'm a bit more worried about having them memorize the Clapp, Colpitts,
and Pierce
Oscillators. Isn't that stuff still on Tech exam?

OhHellNo! Techs need to memorize band edges and remember the 2 basic
rules: E = I * R, c = lambda * f, and a meter is really close to 40".

I doubt it's even on the _commercial_ exams any more, though it sure
was when I got my Second Phone, back in 1962.

http://www.access.gpo.gov/nara/cfr/waisidx_06/47cfr15_06.html

Part 15.223 says in part...

"Subpart C_Intentional Radiators
Sec. 15.223 Operation in the band 1.705-10 MHz.

(a) The field strength of any emission within the band 1.705-10.0 MHz shall not exceed 100 microvolts/meter at a distance of 30 meters. However, if the bandwidth of the emission is less than 10% of the center frequency, the field strength shall not exceed 15 microvolts/meter or (the bandwidth of the device in kHz) divided by (the center frequency of the device in MHz) microvolts/meter at a distance of 30 meters, whichever is the higher level."

For CW operation, your bandwidth is zero for all practical purposes. You will therefore be allowed 15 uV/m at 30 meters.

From this I made a very crude estimate of your allowed transmitter output power. Assuming your transmitter antenna is 100% efficient and radiates hemispherically, your transmitter output power is allowed to be no more than about 1.7 nanowatts (1.7e-9 watts). For ideal circumstances (0 dB receiver antenna gain, 100% efficient receiver antenna), you would get less than 5 uV at a receiver 400 meters away. I stress that this is for ideal circumstances. If your transmitting antenna is less efficient, you can run more power, but less of your power gets launched. How efficient is that antenna, anyway? On the other hand, your antenna may have some directivity which would further limit your power.

This is making my head hurt.

All that can really be said about this estimate is that, to be safe, you should not have much more than about 2 nanowatts output power unless you have the ability to measure the field strength according to regulations.

Good luck with your project.

73,
John

(eternalsquire@comcast.net) writes:

> What I want to do is provide each kid with a popcorn CW transceiver for the colorburst frequency (3579 khz), a key, a short random wire, and a battery. That way they could practice amongst themselves with myself as occasional net control.

The last thing in the world you want to do is give them the ability to send and receive. Because then you'll get a bunch of senders and nobody who can receive.

I made the same mistake when I was ten and got a morse code set. Two units connected by wires, and you could switch between a morse sounder, a light bulb or a buzzer. It was great for sending away, but the problem was there was nobody to receive. And sending didn't mean a thing in learning to receive.

I think it's correct to believe that youngsters would be interested in morse code, a "secret language" at an age when "secret language" means something.

But I don't see this helping.

You need to send to them, something they don't need licenses for or a worry about whether the transmitter needs a license or not. But then, they do need receivers. Only later will they have the ability to communicate with morse code.

They don't need license-free transmitters to get a feel for ham radio. They can talk (and if they know morse code, send) as third parties over your station. You can build up simple receivers for them, or better yet get them interested in building their own simple receivers, and then listen to a ham band or your code practice transmissions.

Building the receivers is a way to get them enthused about the hobby, if done right. Again, getting the thing to work is a sense of accomplishment, and it doesn't matter how simple the receiver might be.

Charles Kitchin has had some simple regen receivers in QST in recent years, using easy to get parts. I looked at one and everything could come out of a good junk box. He had one that used a color subcarrier crystal, again an easy to get part and which made it easy to tune. At least one of the articles is at the ARRL website for all to access. Do a websearch on his name, and you'll find that various clubs have done it as a group project.

But also, when amateur radio is taught in schools, it always looks good, because so many pass the test. I'm not so sure so many stick with the hobby. Some of what's appealing about the hobby is that it's not for everyone. I passed the test when I was 12, and it was something to boast about at school, if school hadn't ended just before I got the test results. I'm not convinced it would have had the same appeal if it had been a regular school thing.

So often amateur radio benefits those school kids as a catalyst for other things. And thus it's important that in this case getting the ham license isn't the end goal. Getting them interested in learning, getting them interested in building, even getting them interested in communicating should be the goal. If they get something out of building a simple radio receiver, then that's more important than passing a test but getting nothing.

So letting them be third parties on your radio, and talking to distant places, or even other reserves, is beneficial, whether or not it leads them to getting a license. Getting them interested in building, be it a radio receiver or some other gadget that can be made with junk parts, is beneficial in itself. (And maybe a reservation isn't the home of much electronic trash, but it's generally so easy to get that they could learn from the act of taking things apart.) Build up various means of sending morse code, and use that as demonstration of things, rather than seeing morse code as the goal. You can send morse by radio, and light, but you can also modulate a light so you get a tone with morse code out of the speaker at the receiving end. During WWII there was various activity using the earth to send and receiver (since ham licenses were in suspension), and that's another neat thing. You need to show them that there are neat things, before they can pursue those things.

These things are the lure to get them interested in amateur radio. They help to make going after the license appealing. But if it's done right, they will benefit long before they make a decision about getting a ham license.

In fourth grade (1952) a camp counselor had built a voice radio transmitter that put out a signal on the broadcast band that we could hear all over the campground. Was it illegal? HELL yes, it put out almost a watt into a random wire antenna. Could it be heard a couple of miles away? HELL no. It was a watt into a junk antenna.

That illegal transmitter put this kid into a 50 year career as an electronics engineer with a lot of stops along the way.

My advice ... build a VOICE transmitter that has a couple of miles range and let the kids have fun with it.

Licenses, we don't need no steenking licenses...

Jim

Ignoring your legal question, a suggestion:

Radio isn't too impressive among kids these days. Especially in lesser-developed parts of the world (I honestly don't know how much that overlaps with these kids?) everybody has a cellphone anyways.

So if Morse code is to be an attractor (and it is, being an arcane art with secret-code aspects, going to be somewhat attractive to at least some kids), start with wired operation. Yeah, it's really super-basic: battery, key, beeper, wires, maybe a blinking light bulb. But if you skip the basics (and it sounds like these kids may have already missed the basics) then they'll get nothing out of it anyway.

I've worked with similar school-age kids in a vastly more developed/educated part of the U.S. and they generally don't know how to wire a light bulb to a battery even though they all know how to use a USB keychain to exchange MP3's via myspace accounts.

If you're lucky, you'll find a one or two techie kids who take after the detailed radio interests not too different than your own. Otherwise, aim low, very very low in terms of complexity, in an effort to bring up the low end rather than cater to the one or two kids who would really benefit from your more advanced plans.

Tim.

And remember, it is much easier to ask for forgiveness than for permission....

Do what you gotta do, but don't advertise. There is always someone around who will try to make a big thing about it. And for goodness sakes, don't tell anyone involved that what they are doing is illegal. (Also, I would advise against posting this on newsgroups :>)))   )

Andy

In looking to build a tuner, I was looking at an L-network tuner, with switched inductance. If I also add a switch to make it a series-network (capacitance "before" or "after" inductance), what would be the limitations of such a design?   I.e. What types of antennas, or under what conditions would it be inappropriate?

Thanks.

And they say the American spirit is dead? They say the men have all
been "feminized" in America? They say the pointy-head attorneys have
brain washed everyone with threats of litigation? They say the
multi-dollar corporations now run the people like a heard of sheep under
thought control?

Hmmm, I wonder ... <grin>

Warmest regards,
JS

Tim:

I really find there is a LOT of interest in radio these days.

Example:
The wife and I got a pair of maxon 49.??? Mhz communicators, vox, etc.
At first, we got them for the motorcycle we had, the head gear can be
jammed under a helmet and the transceiver clipped on a belt, great for
talking while going down the road.

Lately, with the super walmart and all, we have been using them while
shopping, it is always easy to locate her in the store and we can shop
together even though we shop apart. Or, I can wait outside and just
meet here when she is checking out.

Point is, I can't get through the store without someone striking up a
conversation over these things. If I mention other areas of radio I am
involved in, it can easily turn into an hour conversation ...

Point being, an interest in radio is actually easy to begin in others.
Biggest problem I have noted is that people just don't talk anymore,
with these "conversation starters" on, they do!

JS

John,

So, say I had a CW oscillator on the colorburst frequency. I'll shunt
the output
with a 50 ohm resistor to ground. I'll put a random wire at the top of

the
resistor.

Basic equations yield P = (EE) / R

If R is 50 Ohms and maximum output power is 1.7e-9 watts, then E
is 4.1e-5 volts.

So, would a measurement of 40 microvolts or less across the resistor
be satisfactory?

Thanks,

The Eternal Squire

Good question. And, although I support the effort, which was stated, in helping the youngsters--you also must recognize I would be slow to give advice. I don't wish to invoke the pointy-headed attorneys when I have no horse in the race ... <grin>

Proceed at your own peril ...

Warmest regards,
JS

Okay, suppose I make a colorburst CW oscillator and shunt it with a 50
ohm resistor.
I'd put a random wire at the top of the resistor.

So from basic equations P = (EE)/R, with a power limit of 1.7 nanovolt
this gives a voltage limit of 0.6 microvolt.

I'm afraid I don't have a voltmeter or scope that goes that low.

Just think! Instead of the Indians having a monopoly on all gambling in
California (yes, I know, it is really vegas using the Indians), they
could now go ahead and get a monopoly on all broadcasting!

Myself and a colleague discussed the number of permits and variances
needed to launch real, orbital-type rockets and wondered how much would
be required if you launched from a Native reservation.

[...]

>What I want to do is provide each kid with a popcorn CW transceiver for the colorburst frequency (3579 khz), a key, a short random wire, and a battery. That way they could practice amongst themselves with myself as occasional net control.

[...]

>My question is this: so long as final output to the antenna is within the requirement of part 15 unlicensed operation, is part 15 unlicensed operation allowed within a band normally governed under part 97? Part 15 operation would easily cover a 30 mile radius on 80M.

>If no, I'll run the net under part 15 on the edge of the AM band near 160M.

>Thanks in advance,

>The Eternal Squire

I think this is an excellent, and well-intentioned, idea in principle. Others here have given good advice about being careful about power levels. The Technical Information Service (TIS) at the American Radio Relay League (ARRL) has put together a very comprehensive and informative web page relating to Part 15. It's particularly helpful in explaining about how Part 15 fits in with Part 97. It can be found at:

http://www.arrl.org/tis/info/part15.html

Especially note the "Myths" and "Scope" links at the above site.

I certainly hope Paul is an attorney, as if he speaks about the reservation, I hope he speaks with knowledge.

Here is a paper which will demonstrate there is "quite a bit of controversy" over legality of 97 and 15 on reservations:

http://www.fcc.gov/sptf/files/0801fcc.pdf

Course, with some, an amateur license immediately makes them an authority in all areas ...

Warmest regards,
JS

The Navajo people have a proud heritage for their WW2 participation in usage of their language for communication in the Pacific (Japanese could not break it). See movie - Windtalkers (and a couple of others).

CW may be of interest to some - in that it is also a human translated code --
that was a foreign to 19th century US citizens -- as Arabic is to many 21st century Americans today.

You should contact the VEC to see what accommodations they could make -- to assist you for testing. Good luck with it.

Hi Marc:

TenTec has made tuners of that design for many years. I have one in my shack and it works very well for me. The advantage of the L-network over the more common T is in ease of tuning. The L-network has only one correct tuning spot for each load. The T network can have several "matching points" some of which can result in large internal losses instead of an efficient match. The L network has slightly less loss when matched than the common T network. The main con for the L network is the requirement to switch the capacitor around to match loads that are greater or smaller than the input load.
Other than the above both networks do the same thing and there is nothing T network can do that the L network can�t and it needs one less capacitor than a T network.
You can see I�m biased to the L, try one you will like it.

Nope. It's not on either the Tech or General exams. It does show up on the

Extra exam. Even at that a person might or might not get that question on
their particular exam. Take a look at the Tech test pool on the ARRL set.
You will see that it just covers basic stuff.

I am not a lawyer. When faced with legal questions about my own operation, or when trying to help keep apparently honest and sincere people like "Eternal Squire" stay out of trouble, I defer to the true experts. Existing, compiled, and expert advice like that provided at the ARRL TIS site I previously mentioned would seem to be a good place to start. I also value the insight provided here by Usenet participants who are attorneys with experience in communications law. I would certainly defer to their input on this matter, if offered (*).

I also ask myself if I am obeying the spirit as well as the letter of any law or regulation. I don't feel it's within the scope of good amateur practice, personal ethical conduct, or even just overall "good neighbor" guidelines to be focusing on alleged loopholes such as being on a Native American Reservation, in international waters, or an "educational project." Often such excuses are transparent, self-serving, and not borne out in actual legal practice, regulations, treaties, enforcement, etc. Unless I had a lot of legal resources at my disposal (pro bono counsel, etc.), I would probably not seek to try and make myself a legal test case, as some on the newsgroups seem bent on doing.

I would hope that "Eternal Squire", whose post implies that he is a licensed radio amateur, is thinking along these same lines, also. I offered my layperson's advice in that context.

>Here is a paper which will demonstrate there is "quite a bit of
>controversy" over legality of 97 and 15 on reservations:

>http://www.fcc.gov/sptf/files/0801fcc.pdf

I read the above transcript you provided. I note with interest that my friend, fellow ham, and Usenet peer Carl Stevenson (WK3C) was a member of this workshop. I'd certainly defer to his technical expertise. However, the gist I got from the transcript, and from asking legal experts, is that case law is mixed on the subject of whether what happens on a reservation is strictly an internal, tribal matter. That no one present at the workshop wanted to venture an authoritative answer doesn't meant that there aren't those involved in enforcement who could give one. Radio transmitters and casinos are given as principal examples where case law, practice, and jurisdictional agreements go against the assertion that on a reservation, U.S. law does not apply.

>Course, with some, an amateur license immediately makes them an
>authority in all areas ...

It was a question about amateur radio, asked in an amateur radio newsgroup. I suggested that he seek expert advice, such as that summarized at the ARRL TIS web site I linked previously. No more, and no less.

>Warmest regards,
>JS

(*) I did ask one of the experts in communications law that I know personally. He offered the following observations:

> "I would add something to the extent that you have been advised by a communications attorney with over 50 years' experience in FCC regulatory matters that unless there is a specific treaty granting a tribe authority to regulate amateur radio transmissions on a reservation, and there isn't, FCC law and jurisdiction prevail. There are agreements giving tribes authority to determine who may operate a broadcast station from a reservation, but the FCC must regulate the technical parameters (frequency, power, location) to be observed and grant the callsign and make all necessary international notifications.
>
> Similarly, in international waters or airspace, the country of registration of the vessel or aircraft retains jurisdiction, and any country may lodge a complaint of violation of the International Radio Regulations with the country of registration if that is the case.   If the vessel or aircraft is 'unregistered', any country has the authority to blast it out of the water or the air, although that is a drastic measure. The International Radio Regulations do, however. oblige all countries to not condone or support any radio (or TV) broadcasting from international waters or airspace."

As this seems to be drifting into a *.policy area, and not *.homebrew, I've set followups as appropriate. Feel free to override my default if you must.

Paul W. Schleck wrote:

> ...

Well, I must admit, anyone affiliated with the ARRL turns me off, as it does many. Although they cannot, possibly, be held directly and solely responsible for bringing amateur radio to the brink of disaster it now hangs at, they certainly have never helped much, well, other than themselves.

However, I would strongly suggest anyone to investigate all of the options open to an Indian reservation, the laws which govern them are much different than those governing all other areas of the USA. If I read that paper correctly (mentioned in my earlier post), the FCC would seem to be mostly interested in the rf which left the borders of the reservation.

I know ripples of shock went through the population of California when they were allowed to operate gambling casinos. Something most did not expect.

I would not be surprised if further surprises along those same line do not await us ...

Now, as to the rest, I am simply not impressed nor interested ...

Regards,
JS

Ok, please dont everyone get mad at me, but I just started puting this together and I really would like to promote my new holography kit and I think it may be something of interest to you all. I put together a web sight, and I would also like feed back on the sight.

So PLEASE even if you dont go buy one (and I dont blame you, it's not everyone's thing) please give it a look and if you have any sugestions,

let me know, I actualy plan to 'open' on feb 1st, but the sight is funtional, just unadvertised now. Any way the addy is

http://dcgkit.t35.com/

I hope no one is upset, I know it's a comercial endever, but I do think

it's a subject of interest to the group.

Daniel

As I remember, gambling on reservations had almost that/those humble beginnings ...

It is clear, in my personal opinion, the FCC would have NO interest in rf levels on the reservation, and ONLY those leaving the borders of the reservation would EVER come into question ...

People living on the reservation have all the consumer electronics that can be interfered with that people living off the reservation have.

Jim:

Let me go a bit further on this. I happen to have a sister who works for Child Protective Services in California (CPS.)

If you are Indian (even part) and CPS pays you a visit, and you ARE Indian, they must immediately back down and defer to the Indian Council on the reservation/tribe which the person in question is a member of ... that individual is NOT subject to the same laws you or I would be.

Let me go a bit further:
If you are Indian, the welfare agency will provide "different" benefits to you than some others. Indeed, the Washoe Tribe of California and Nevada "chip in" and provide you with "expanded" benefits and medical assistance.

The above was/were gleaned though discussions with my sister over time ... anyone interested can investigate for themselves. I am intrigued by the fact the Indians care for their own so well; I would be interested in knowing more.

Regards,
JS

Jim:

Most likely equal or better!

Those Indians living on the reservation in Amador County receive approx. $5000.00 per month/per individual.

A family of three would get about $15,000 a month from the proceeds of the casino, if they actually work in the casino, more ... they don't pay taxes on their cigarettes either!

That just ain't bad, and leaves a couple of bucks left over to purchase hobby items ... some drive nice Hummers, I have noticed ...

Regards,
JS

I think it would be about 300 uV across 50 ohms (I think you are off by
about an order of magnitude). Yes, I think that would be okay. A good place
to understand this stuff is on the ARRL site. Look into the BPL and RFI
things there. Read everything you can find about this subject. If you
research this thoroughly, you will find allies in the field, I'm sure.

My intent here is not to discourage you in your project, but to encourage you to think critically. Always ask yourself why this has not been done before. Most of the time there is a reason, but sometimes (a small percentage of the time) it is because nobody has had an interest in the subject.

But, you didn't ask for my philosophy. I sometimes get carried away. I apologize for that.

Cheers and 73,
John

Paul,

Its my opinion, the fact that these childrens' homes are on Navajo Land is legally irrelevant.

>From what I understand, Native territories are jurisdictions having roughly equal standing

to the states, but just like states are still subject to the
Constitution and to Acts of Congress,
such as the one authorizing the FCC and parts 15 and 97.

As for using a pseudonym, I use that rather than my name or call for
obvious reasons of
personal safety for myself and my family.

Cheers,

The Eternal Squire

I have been thinking about this for a while before making this reply.

I would strongly suggest looking at the lowfer band.
160Kc to 190Kc
The limitations are relatively straight forward.
Maximum length of feed line, and antenna are 15meters.
Maximum power input to the final amp stage is 1W.
No other real limitations besides the fact that out of band emissions have to be below a specific point.

That is about a 50 foot long antenna. There isn't much of a chance that they will try to string one up longer than that, unless they were really industrious.
And they can learn about antenna loading, to get a better transmitted signal/range.

The one watt input power level is easy to determine. If the input is 10V then adjust the current to a maximum of 100mA.

They can use any mode of communication they want. CW, AM, SSB, FM, PSK31, BPSK, MFSK
The sky is the limit as for as modes.

If they have computers, most of the digital modes can be implemented with soundcard based communications software that is available as freeware
Look up "MULTIPSK"

They can set up beacons for propagation checks, or talk to each other in real time.

30 miles is an easy distance to reach with basic loaded antennas. Especially with PSK31 and CW.

It will allow them to learn how to build receiving antennas.

And if they can't reach, or hear someone on the other side of the reservation, then it will allow them to learn the basics of traffic handling by the stations in the middle relaying information from one station to another.

It will also teach them the basics of the narrower bandwidth/greater range relationship. With the low bandwidth BPSK, PSK31 modes, they will easily communicate across the reservation even if they can barely hear each other on voice.

You can either get kit equipment for receiving or transmitting, which is widely available on line. Or you can design and build your own.

If they are lucky, they may even hear stations, and beacons from hundreds of miles away. Or even thousands. There is nothing like the thrill of DX.

If (mind you, IF) I was going to make a device that would bootleg a signal over a 30 mile range, the LAST frequency I would pick is one that had a real good chance of messing up somebody's color TV set in that radius.

Google on Mouser, crystal, and you will get HUNDREDS of cheap crystals that aren't going to be messing up anybody's home entertainment devices. You might also google for "emergency frequency" to keep away from the Coast Guard's "hit the red button" frequencies.

If it twer me, I'd probably find a quiet spot on 80 meters for the little rugrats.

Jim

This may not be what you are looking for but it is a clever way to make a Hartley oscillator using two inductors without any coupling between them:

"Hartley oscillator requires no coupled inductors," by Jim McLucas, EDN Design Ideas, issue of 26 October 2006. The example is an 18 MHz oscillator using dual-gate CMOS FETS but the principle of transforming coupled inductors to two individual inductors would be sound for any active device.

It is available at Design Ideas Archive at www.ednmag.com.

> You can either get kit equipment for receiving or transmitting, which is
> widely available on line. Or you can design and build your own.

Maybe I should clarify one of my statements before someone calls me stupid.

I mean easily modifiable equipment is widely available online.
It isn't sold for Lowfer operation.

Most heterodyne and direct conversion based short wave, receiving kits can
be modified over to the LF band from 160 to 190kc

On a 455kc heterodyne receiver, push the local oscillator down to 615 to 645
kc, and put a band pass network on the input peaked to the lowfer band, and
you are done.

Same thing can be done for SSB transmitter kits that use a fixed transmit IF

Only thing is, such low power xmitters, if designed and tuned to a "quiet" portion of the mw band allows anyone with a standard am radio to tune into and participate in ...

Rip apart any old transistor radio and you have the necessary parts for the xmitter ...

VLF receivers can be a tad bit expensive ... however, most am radios would easily be modified to VLF ... the patience of the elmer would be the only resource in question.

I agree. I was just rebutting the bad advice given here that you should try to focus on legal loopholes or otherwise "stretch" the law in some way. Especially when that advice is based on an incomplete or inexpert knowledge of the law, whose misunderstanding could have expensive consequences. I know that hams in general are an honorable lot, and as a whole would not attempt to think or act that way. I'm glad that we are thinking along the same lines. Which is one of the reasons that I believed that you were sincere, and a licensed amateur radio operator.

>>From what I understand, Native territories are jurisdictions having
>roughly equal standing
>to the states, but just like states are still subject to the
>Constitution and to Acts of Congress,
>such as the one authorizing the FCC and parts 15 and 97.

Treaties with Native American tribes, and resulting laws and inter-jurisdictional agreements bear out that viewpoint, according to the expert that I consulted, and quoted in my previous post.

So, the one remaining question would appear to be your original one, which was where does Part 15 leave off and Part 97 begin? I think that the ARRL TIS site that I linked previously is a good place to start. I invite everyone to consider the excellent advice offered at that site, including links to FCC documents, independent of prejudicial dislike of the involved sources or personalities.

>As for using a pseudonym, I use that rather than my name or call for
>obvious reasons of
>personal safety for myself and my family.

That's too bad that Usenet has degraded to the point that we actually fear for the safety of ourselves and our families when we participate here, and merely state our intentions to operate lawfully, and not tolerate unlawful behavior. I'm honestly surprised that these are controversial viewpoints in some quarters.

Personally, in nearly 17 years of participating on-line, I've never felt the need to use a pseudonym, or feared for my safety. However, I respect the reasonable personal choices of others in this regard.

The first thing that came into my mind when I read that is.
Is there even such thing as a "quiet portion of the MW band"?

The normal AM band has so many multiKW stations running on it that it is
heavily polluted with RF noise.
The general coverage receiver I have, has a 200 Foot long antenna hooked to

it.
Night or day, It is hard to find a broadcast channel that isn't giving a signal reading running from S5 to S9 even when you can't hear any traces of a broadcast signal.
There is so many distant stations being heard at once that it turns into indistinguishable noise.

And if you do catch a quiet channel, it only last for a few minutes, or hours until propagation changes, and the noise level comes back up to normal.

Once you drop off the edge of the AM band, the average noise level drops down to almost nothing within a few Kc of the edge.

After you get past a certain grade of radio and RX antenna, you will not gain any improvement because of the base noise level of the band. They would basically be reduced to fighting the TX side of things, to try and stay above the average noise level.

Can you say "CB a few years ago"?

The only reason the horrible noise level isn't apparent on most AM receivers sold in stores, is because they are so insensitive that they can't hear even relatively loud signals. That is why I almost consider it a waste of money to buy a standard AM/FM radio that is currently on the market to listen to AM. I have built crystal radios that are more sensitive on AM than some of the high dollar AM/FM radios I have used.

A lot of AM/FM radios I see any more, don't even have an IF section, with IF transformers. If you are lucky, they have a 455kc crystal filter, in a section that can barely be called a IF section.

You are taking a big handicap when you stay on the AM band, and use a standard off the shelf AM radio.

You have to use a radio that is designed for SW use, where the average noise levels are a lot lower, better selectivity, and the radio has a higher total gain from antenna to speaker.

If I was designing a simple software IF radio for them to use with their computer, Or a basic SSB voice rig, here is the basic layout i would use.

The IF for receive and TX would be 455Kc using off the shelf AM IF cans.

TX side.
450Kc or 460Kc crystal feeding a balanced modulator.
Soundcard driving the other input of the balanced modulator.
Feed the output of the modulator through an amplifier to an off the shelf 455Kc center frequency, 10Kc bandwidth, crystal filter used in the IF of standard AM receivers.

Feed that into a mixer being driven by a 630kc local oscillator.
That will yield a 170Kc to 180kc coverage signal that you can feed into a

band pass filter.
Feed the band pass filter into the final amp.
Feed the final amp into the antenna coupler/ second band pass filter, and then to the antenna.

That will allow you to use about 1/3 of the entire lowfer band without changing any frequency in the transmitter.

Just set up the receiver with the exact opposite of the TX.
And you can use the TX crystal oscillators to feed the receiver, so the RX frequency will be a mirror of the TX one.

The antenna coming in to a band pass filter.
One stage of RF amp if desired.
Feed that into the RX mixer.
The mixer uses the same 630Kc local oscillator as the TX section.
Run the output of the mixer into an IF strip, with an identical 455Kc crystal filter.
Run it to a final detector being feed by the 450/460Kc crystal.
Feed the output of a detector into an audio amp, then to the input of the sound card.
Put a little AGC in here and there, and you are ready to go.

With that setup, they could have several conversations going at once on different digital modes, without bothering each other.

For an AM transmitter I would just use a crystal oscillator driving a modulated final amp.
And for the receive end, I would just use a modified AM receiver with a GOOD IF!!!. There is even a few general coverage radios that already has 160 to 190Kc coverage that would work fine for a receiver..

You have presented the above well, I am in agreement ...

The world is always a compromise between what one wants and what is
actually to be had.

Too bad there are none of the dollar-ninety-eight kits out there--like
there was when I as a boy. (or tons of old military equipment to be had
for a song)

Warmest regards,
JS

"N9WOS" (N9WOS@nobug.sbcglobal.net) writes:

> The first thing that came into my mind when I read that is.
> Is there even such thing as a "quiet portion of the MW band"?
>
> The normal AM band has so many multiKW stations running on it that it is
> heavily polluted with RF noise.

The solution is actually simpler.

Since realistically the kids don't need to communicate before they actually
can, they need to receiver code practice. There is, again, ample chance
to convey the hobby to them before they pursue licenses, and once they
have licenses pretty much "anything goes" because of the very nature of

amateur radio.

The solution is to get the community involved. These are their kids, they want them to do well in the world. Presumably there is a radio station on the reserve specifically for the reservation. So get some space there to send code (obviously a code practice oscillator into the microphone input) for a bit. It could even be as simple as a few sentences every day at a fixed time, the same way Jean Sheppard wrote of getting secret messages during the "Little Orphan Annie" show. The reservation near here has bingo games on the air every Sunday night, so why shouldn't a community that is interested in the success of their young not see the point of sending some morse code over the local station?

The point isn't to give them amateur radio before the fact, it's to lure them in.

And if there's no community radio station on that reserve, then I suspect that's of more value than low power stations that may turn out to be a dud. Because a community station can do so much for the community. And one might as well get those interested students involved in the project.

A few years back, at that nearby reserve that has radio bingo, one 13 year old lamented that there was no library on the reserved. They have a library now, it carries her name. This is something that is going to last forever (or hopefully so), and is the sort of thing reserves need. Libraries are places where people can find those books about radio and electronics when they suddenly become interested, or lure them in when they stumble on such things.

Getting the kids interested in science and even specifically electronics is a good thing. Done well, it will even benefit them if they don't pursue such things later, because the teaching becomes a catalyst for other things.

But sometimes one has to look at projects and wonder if they will really make change, or if they are just neat in themselves but will actually bomb (because the kids lose interest, or because all kinds of money and resource is put it into something when there are simpler things to do the same thing).

To Whom It May Concern:

Just so you have a complete picture of Paul W. Schleck, I took the following from one of his posts in news.groups.proposals:

"Mark Morgan, KB9RQZ, is correct that all of our proposed moderators and consultants hold the highest class of Amateur Radio Service license in their countries (Amateur Extra for the U.S. team members, Class A or similar in the case of Jack Cook, who holds both UK and Australian licenses). However, that doesn't mean that we would be judgemental or unfair to other classes of license. We would certainly be open to adding moderators to our team that hold other classes of license. We will certainly decline articles that are disrespectful to or prejudicial against other participants for any reason, including license class. We would prefer to judge ideas, and take posts at face value, rather than prejudge individuals and credentials in a vacuum."

Now that just speaks volumes about this man, his caliber, his "ethical standards", etc. Now, doesn't it?

Gawd! I feel sick ...

Warmest regards,
JS

Unbelievable, is there ANYONE here who believes Mr. Schlock... err, Mr.
Schleck would be "fair" and just to ALL?  That he would consider
ANYTHING other than his own petty gripes and bitches?  If so, step right
up here to defend the man, I am waiting ...

My gawd, the man is so crooked he makes my dogs hind legs look straight!

Regards,
JS

Here is what my response to Mr. Schleck would be on his proposed moderated newsgroup:

Mr. Paul W. Schleck:

I would question your ability to be a fair and just moderator. I have participated in the rec.radio.amateur.??? newsgroups, I have witnessed your abilities and goals.

There, I have seen you and your extra class henchmen attempt to constantly steer the course of its' flow, intimidation and threats have often been your tools. I have watched you and others look down upon other amateurs who will now be allowed to take a "No Code Amateur Exam." In no way have I ever seen you be even close to being "fair" or "just" in your opinions, judgments, statements, etc. I have heard many in that group call the present amateur exams "dumbed down."

Here, you have blatantly lied as to your purposes. You seek a forum where a very limited band of ideas, concepts, beliefs and discussion can take forth. You seek to establish a "class based newsgroup", this class system will VERY MUCH depend on the ancient art of morse code and the amateur exam.

If any here doubt, they only have to sift though the old posts and check past posts of you and those you name as would be-moderators and they will know. What I say, I say with great belief.

You wish to establish a "masonic temple type of brotherhood" here in the public newsgroups. You and a few of your cronies wish to establish tight and strict control over this group. And, from what I can see and guess to your goals, you do this SOLELY for the purpose of stroking your own egos.

Many of the "weirdos", hecklers and vulgar individuals in the other amateur groups are due to you and those sharing your same views and using your "street smart" methods--in effect, your "control freak" attitude and "better-than-thou" stance has created them.

It would serve justice if you were forced to stay and learn to "get along and play well" with the other "children."

Your words show a fine demonstration of stealth and deception; I don't believe I have ever seen a better example than you have presented to us here. I certainly would nominate you for the "Silver Tongue Award."

However, I would certainly NOT vote to allow you to slink and sneak off from the tragedy you have helped to create.

Although you make this request and proposal out of your personal need to feed your ego, and surround yourself with those who would feed your ego for you, and "live in your own little world", I think it would be a crime to allow you to do so.

The potential you have to abuse this proposed-moderated newsgroup to the detriment of others demands it should not be allowed ... I for one would vote NO, but then, you already knew that ...

Regards,
John Smith I

OK John, clean up this newsgroup so I don't have to add filters on an almost daily basis to eliminate the constant deluge of sex posts, vulgar posts, etc.

Dee, N8UZE

Dee:

There I agree with you 100%. The vulgarity and sheer non-sense makes me
embarrassed for them. I cringe at the mental state they must exist in
to wish to provide such a display in front of women and younger users here.

I fear that this does not just exist in the newsgroups, here with us,
but also is becoming "something bad" in America :(

I can only admire you in finding the tools and having the determination
to be here with us in spite of all that non-sense ...

Warmest regards,
JS

Its a good idea, might even make a fine commercial venture.  My only
problem
with 160 to 190 khz is that its a public band, not an amateur band.

My reason for operating 80M under part 15 is that as a code practice
group
they can get used to courtesy and usage as well as operation, and
anyone
who happens to listen will simply hear just another group of brass
pounders.

Immediately after getting the license they can keep the same rigs but
then
start an amplifier project.

Another question would be temporary callsigns.   I was thinking that
each kid
would have the call 15XX, where XX is the first and last initial.

I sure see lots of retired cell phones and wonder why I haven't seen any
homebrew projcts to make something useful out of old outdated ones.
I realize that the last few years may be too complex and small but how about
the old analog shoe phones?

Ww wow wow wow.... put the brakes on here a second.

There is a little flaw with that logic.

People do listen around the band, and type up the callsigns on websites/books/CD ROMs, and a lot of logging programs have callsign lookup, or at least rough location determination based on call layout.

There is never "just another group of brass pounders"

There is plenty of people that operate at levels of a watt or less, with the full knowledge that when they pound out a CQ a couple times, that someone, or sometime a bunch of people, will be looking through the band, hear them, and respond, so they can make a contact.

Local CW ops, and even some at quite a distance will quickly determine that there has been a flood of "very strange, illegal, but slightly weak people that don't do code very well" cluttering up a specific frequency, or cluster of frequencies.

Of course, the operator/s will subsequently have kittens, and all attempts to make ham radio operators look like a bunch of angles will go down the drain.

Of course the operator/s will try to get the group of "freebanders" to leave. If they don't listen, then the operator will do his solemn duty and he will get reinforcements, and the frequency will sound like world war 25 has just broken loose, pronto.

Them using random, made up callsigns will speed up the process, because there is plenty of people that cruse the bands, looking for rare DX. How do you think pileups happen? When they find a weak station using a rare callsign, it will hit the DX clusters, and all hell will break loose.

Heck, one of the groups that I always listen to on 160 had a little fun one time. One of them made a joke by saying that he was (something thousand miles) south east of anchorage Alaska. (ie) In Iowa. And all of a sudden, there were tons of people on the frequency asking where the Alaskan station was. And carnage issued. Some casual passer by had heard the Alaska reference and forwarded it to the DX clusters.

I can see so many ways that that setup could lead to total carnage in so many ways.

You will have some poor child asking his parents why someone would want them to stick such and such in up their tail end.

What you see is the FCC side-step the question. I do not believe they wish to take on the Indian nation. Indeed, I have heard of little success in any gov't agency in doing so.

Those treaties signed many moons ago by our forefathers still stand (Navajo, especially, have refused every attempt at revision), and they are very, very broad ... like gambling was probably accepted in all the territories back then. Like radio was NOT invented back then ... do you even know how large that reservation in question is? Try the size of West Virginia. Know how large that tribe is? Try the largest in the USA.

Some reservations have sent men to the best colleges and have some of the best attorneys in the world. If you doubt that, take on the Indians. California did, and lost ...

Regards,
JS

What kind of projects did you have in mind?

These days with DigiKey, Mouser, etc. it's often easier just to design
something from scratch, and that way anyone can build it (rather than trying
to track down a specific model phone...).

Would a call sign like PART15XX make it a lot clearer and a lot more
obvious?   I wonder what the FCC would suggest for micropower
CW callsigns.

(Cough cough)....... yap!!!!!!!

I couldn't really think of a way to avoid a cataclysm that is why I ditched the idea of using the ham band, and especially the color burst frequency, without second thought.

The 3.579545Mc (Got a color burst crystal in my hand right now.) frequency is popular because the crystal is so readily available. So it's used in a lot of homebrew equipment. The crystal may be pulled up or down a bit in frequency, but within a few KC of that frequency.

You would basically be dropping them into a hornets nest of activity.

Any other alternative would be highly suggestible, even running relatively high power on the AM broadcast band would have less of a chance of stirring up trouble.

Another idea.
Going with off the shelf CB's would also be an idea. You could use a code practice oscillator held close to the mike, or even wired into the mike circuit, to send code practice. You could even implement digital transmission systems via a computer, program, and sound card (RTTY, PSK31, MFSK) if you wired the soundcard output into the mike. It would work perfectly fine on Stock AM. Only one person could use the frequency at a time. It wouldn't exactly match the designed method of operation, but it would work. It would get them familiarized with the modes of operation.

If you spent the money on SSB CB's then you could fully implement the intended method of operation for soundcard/computer based programs. And it would allow multiple people to carry on a PSK31/RTTY/BPSK/MFSK..... conversation on the same channel without bothering each other. Basically the same as you would have on the Lowfer band. And you wouldn't really have to build a thing except for a few audio interface cables.

Just get a bunch of SSB radios, the cheapest ones you can get. Wire up a bunch of interface cables to hook the mike, and speaker connections to the sound card, and you are done.

You could also set up a packet network with CB's. Other people have done it.

You could even implement the newest DRM transmission systems that are hitting the ham band if you had SSB CB's.

And the CB band is relatively dead right now, so you have plenty of open channels to work with.

And you can use off the shelf antennas, that are a lot smaller. It would also open up the realm of mobile operation.

There is plenty of options, besides putting them in a situation that is just asking for trouble.

....

A little note to add to that, in case someone thinks that no one will hear a station at a distance that is running real low of power.

A few weeks ago, I was playing with an oscillator design. I had just used a random inductor that i had laying around for the LC network. The frequency that it landed on was totally at random.

That happened to be around 8.199Mc

All that i had hooked to the proto board was the power supply, and the frequency counter, (and sometimes the O scope). The oscillator was developing about a 8V P to P signal across the 1Kohm loading resistor on the proto board.

I wanted to have an audio representation of the oscillator drift, so I went to my normal HF receiver and tuned it in on the SSB setting so i could hear the drift in real time.

The oscillator was being pulled by the frequency counter a bit. When the gate of the counter would open, the oscillator would shift down a hundred cycles or so. The audio signal I was hearing was along the lines of ... drrrrrrrrrrrr duuuuuuuuuuuuu drrrrrrrrrrrrr duuuuuuuuuu...........

I had a reason to turn it off for a minute, and then when i turned it back on, i heard a Burlblbublbublbub ..... for a few seconds, then it went away, for a few seconds, then it went Burlblbublbublbub ..... again, and then went away........ I thought that it was totally by coincidence. There was no way anyone could be hearing it.

So, to settle my mind, that I wasn't going crazy, I shut off the oscillator again, for a few minutes. I never heard the unknown signal in that time. But when I turned the oscillator back on..... About two seconds after i turned it on.......... Burlblbublbublbub........ then a few seconds later...... Burlblbublbublbub....

After subsequent test cycles I had pretty much figured out that it was some kind of frequency hopping signal that I was hearing. The signal from my oscillator must of correlated closely with the type of contact initiation signal that the outside station was looking for. When it heard that warbling tone, it would try to interrogate the calling station (my oscillator) to set up a two way contact. It would try two times, then give up until the signal disappeared for a certain amount of time. When the signal would come back, then it would try to set up a two way contact again

I looked up what band the 8.199Mc signal fell in, and my old reference book said it was a maritime mobile band. The data in the book may be out of date, but if it isn't, then the receiving station may have been a long ways away. Probably some automated ship to shore station along the great lakes. The propagation was just right for my signal to hit their receiver.

Stuff like that is why direct antenna coupled regenerative receivers that are operated in the oscillation region for CW/SSB detection are frowned upon. If they are hooked to a good antenna, then your "receiver" can be heard quite a distance away.

That is why most regenerative kits sold today, have an RF amp stage on the input, to stop the regenerative section from back feeding the antenna.

I have even heard of a few people using a regenerative receiver as a transceiver by keying the tube with the regeneration control turned way up. They only made contact to people on the other side of the island, but it worked. Now try to beat that, a one tube or transistor transceiver!

Sorry I didnt get back sooner, my friend doesnt use email, dont even
think he owns a computer. He said there is nothing special about it,
just a DBM he got out of a book and built on the header. He say he
hasnt been very interested in things like this for years.

Some of the analog shoebox and suitcase phones have separate VCO modules and IF strips. The chips used were sometimes well-documented (I'm thinking of the Signetics and Motorola stuff) and the datastreams for microprocessor control you could figure out.

But you have to go back to the early 90's to find equipment of that era. There were some ham magazine articles at the time these were going surplus. Some of the equipment had diagnostic modes that let you turn them into simplex receivers - not very good quality but OK and their reach outside the cellphone spectrum was nearly nonexistent.

Just to make you jealous: I work just two blocks from where the original actual shoe phone now resides :-). I am trying to persuade my company to get it from them on inter-agency loan...

Tim.

It always surprises me how little useful I can get out of these. I
used half the diplexer from a big old one as a filter for an 875 MHz
local oscillator chain for a 903 MHz receiving converter. And I used
the speaker from a more modern one to provide sidetone for a laser MCW
transmitter. That's it so far....

73,
Steve VE3SMA

1. Ok, easy question first. Someone has given me a PCB for a QRP transmitter called "little joe" and the PCB has 9-81 QST. I have searched on the web but I cannot find the component layout, and, ideally, a copy of the original article.

2. I have been playing around with a simple transmitter project called the Michigan Mighty Mite (http://cs.okanagan.bc.ca/ve7ouc/eng/kc6wdk-mirror/transmitter.html) which uses any one of a number of small signal NPN transistors. As I found a large number of metal cased NPN power transistors, I was wondering if I can drop one of these as a direct substitute for say, a 2n2222, or an old BFY51 etc etc. I have, for example, found a RCA 2n6282 Darlington Pair in my junk box. This is a VERY meaty little beast. The datasheet for this tranny can be seen here:- http://www.datasheetcatalog.com/datasheets_pdf/2/N/6/2/2N6282.shtml

Any suggestions?

FS: Home brew console (floor model) 4CX-1000 amplifier. I am selling this for a friend who did a beautiful job of building this amp. Basically it's a home brew Collins 30S-1 that is commercial quality built. Can send pix to anyone seriously interested. Includes nicely done manual with all info.

$750. Mike, (979) 696-4400.

>

The big clunky ones, and I've not seen any at garage sales in a few years, have offered up things like FM IF strips (they've tended to be really easy to isolate from the rest of the unit), various crystal filters with centre frequencies above 30MHz which would be suitable as roofing filters, some txcos, go back far enough and they have standalone NE570 (or later variants) compander ICs. I've also pulled prescaler ICs out of them.

The trick is that the older and bigger they are, the better the parts. There will be recognizeable parts, and many will even be in DIP packages.

The more recent they are, the less valuable because everthing gets highly integrated. I opened one hand held cellphone, of recent vintage obviously, and the IF filter was barely recognizeable.

Because they were specifically designed to be part of a system (ie you'll never use a cellphone by itself), they have usually been way too dedicated to allow for much in the way of modification.

  MIchael VE2BVW

That's true. They sent one kid off to MIT and he came back with a degree in Electrical Engineering. When he got back home he found that the communal restroom had no lights, so to show his gratitude to the tribe he ran electricity to the bathroom.

So far as we know, that was the first Indian ever to wire a^head for a reservation.

My QST collection only goes back to '88 or so. You could buy a CD from

ARRL, if no one here has the article.

Don't do it!

Power transistors, particularly vintage ones, are very slow in comparison to "small signal" types. Darlingtons are a different kind of thing altogether, they are even slower yet but with significantly higher current gain.

Find a bag of surplus 2N2222s, or buy a dozen new 2N3904's from Digi-Key -- you'll be much better served.

The Dine' (I use the term Navajo because most people outside are more familiar with that) are a very proud people who would resent being made fun of like that.

To the Dine', we are an alien people out of touch with the rhythms of the land, who are obsessed with consumer goods, technology, money, or bigotry.   Even such whites are ourselves who do see what history has done to the Dine' and find it appalling, are viewed as possibly having egotism.

The Dine' are more impressed by whites who listen first then act later in small ways that fit what the Dine' already do.

You have to live with the Dine' least a couple years before you can even begin to understand the challenge of introducing a new technology in a culturally appropriate manner.

The Eternal Squire

ES:

Yanno, that is something which is easy to provide high respect for in your description; which, by the way, I consider to be highly accurate.

Several years ago now, I was assisting to put together a data base for "prediction" of IQ's. One classification we correlated the data to was race (I know, un-politically correct, techs are that way.)

I was nothing short of amazed to find the most intelligent race on the planet, per capita, was the No. American Indian! (when given a "flat test", and adjusted for cultural differences--or, only based on ones ability to "solve puzzles.") That research indicated them best fitted for such tasks as research and development, the theoretical sciences, (and yes) law practice, etc.)

My prejudices, possibly from old westerns?, were so firmly set, I kept searching for a mistake in the software ... in other words, was hard for me to NOT picture them with a "bottle of firewater in their hand." I know, I have made mistakes in my thinking, and that ain't the only one!

I learned something ... in the end.

Regards,
JS

Have a quantity of Test Equipment and Radio Communications Service Manuals, both Commercial & Amateur that I have rescued from the Dumpster. Most of them are in Like New Condition.

> Have recently updated the MOTOROLA & KENWOOD List <

Please check my site: www.rodemi.com   for what is available. Click on the MANUALS Heading.
I am updating the site as time allows.
I recently retired from the Commercial 2-way radio business and would like these useful manuals to find a good home.

Thanks for looking....Norm VE3CZI
Email me Directly: <insert Call Sign> at arrl.net ....<call sign> is ve3czi

Just a follow-up, maybe someone finds it useful. I found 4 links for
Ottawa, Canada (in addition to digikey):

http://www.alliedelec.com   (online only)

Gervais Electronics Retail Walk-in
#1 - 716 Industrial Ave., Ottawa, Ontario, K1G 0Y9
Toll Free: 1-800-267-2742, Phone: 613-738-3101, Fax: 613-738-1188,

Email

Active Tech Electronics Retail Walk-in
1023 Merivale Rd., Ottawa, Ontario, K1Z 6A6
Phone: 613-728-7900, Fax: 613-728-3586

Reset Electronics Retail Walk-in
1050 Baxter Rd. Unit 10,Ottawa, Ont., K2C 3P1
Phone: 613-596-5544, Fax: 613-596-9079

Hope it helps someone.

Speak for yourself. My grandmother was of the Crow Nation and it has been my observation that most evolved peoples have a sense of humor. You might consider getting your panties out of a wad and lightening up a bit. I ain't any happier than you that my ancestors gave the First Nation the smelly end of the stick, but we both know that time moves forwards, not backwards. It is what we do OURSELVES that we are accountable for, not the sins of our forebears.

I had teachers like you growing up ... sheesh.

Jim

    Even such whites are ourselves

Very well.

Andrew,

A few thoughts about your idea and some of the responses that it has evoked:

First off, I don't think your emphasis should be on transmitting. To me, ham radio is about communication, and communication, first and foremost, is about LISTENING. Listening is what you should emphasize.

Since there are both physical laws of nature and interference (natural and man-made) to contend with, the real magic in radio is the antenna, amplifier(s), filter(s), and operator techniques used to extract useful information from a feeble signal. (Case in point: Voyager 1 is now more than 9 BILLION miles from earth, but as long as its flea-power transmitter holds out, we expect to be able to continue receiving data.)

There is great fun in building simple receivers, and much to be learned.
A few years back, for lack of something better to do one evening, I knocked together a regenerative set on the bench top in the garage. I wound a coil on a toilet paper tube, made a grid-leak capacitor out of a couple of microscope slides and some foil, and hooked up an old #26 tetrode. The rig was "wired" with alligator leads and powered by flashlight batteries. The antenna was 15 feet of wire thumb tacked to the garage ceiling, and the ground was a 'gator clip attached to the cover plate screw of a nearby outlet. A few adjustments later and I found myself listening to a radio-theater presentation of "Dracula" put on by the BBC in London. That's more than 5000 miles from where I live. That's magic.

In your case, a FET based regenerative set would be the ticket. Dirt cheap and effective enough to be useful. (I'm thinking something along the lines of 1 FET RF/isolation, 1 FET regen stage, and an LM386 amp chip, which will easily drive common walkman-style headphones.)

If you want to teach your kids Morse, use the Code Quick method. Buy a copy of a program called Numorse for yourself, and use this to generate exercises for the kids. You can put the audio on cassette tape or CD's.
When they get up to 5 WPM or so, you have them listen to W1AW. The day after a W1AW session you ask the kids some specific question about the text that was sent the previous night. Offer prizes or some kind of encouragement for positive responses. Once they can receive Morse, learning to send is rather easy.

This is something of a detour, but have you ever heard recordings of sounds the Ionosphere makes? Remarkable chirps, whistles, clicks, and pops. Slow down the recordings and you get sounds that are startlingly similar to the songs of certain birds, or the calls of whales. The equipment to capture this is cheap and easy to build. This is one situation where a remote location is a real asset, because there is far less man-made electrical noise to foul your recordings. Get a kid hooked on something like this, and who knows what kind of scientific or technical career could develop from this experience.

If you insist on transmitting, or equipping your students to transmit before they even have the skills to do so properly, fine, so long as you are certain that your activities are within the boundaries of the law. With regard to the comments of some in this thread I will simply say that the last thing society needs is a "mentor" whose first lesson will essentially be: "If you don't like the rules just ignore them." I am of the opinion that the preponderance of this attitude is responsible for much of the unhappiness in this world.

Final thought. I few years back I authored a book on the subject of primitive radio, and how to build radio components from scratch. This includes homemade variable capacitors, tuning coils, detectors, and even headphones. The equipment is built with hand tools and made from such mundane source material as wood, tin cans, cabinet magnets, and cigarette lighter parts.

Web link: http://www.hpfriedrichs.com/bks-votc.htm

This book has been critically acclaimed by the editors of QST and Practical Wireless in the U.K., and is recommended by at least one teacher's guide:
http://www.libraryvideo.com/guides/N7003.pdf?mscssid=B7EATDCXALG28J0F5NE5J92CHF5S8T4A

I am sensitive to educational and charitable concerns. If you should express serious interest in using these in a classroom setting, we could discuss how to make this happen.

73

I sort of said something along the same lines, though maybe it's not apparent.

The idea of something more open-ended seems more important than a funneling into something specific. I don't think anyone could see anything wrong with getting the kids interested and even excited about science and technology. But how you get them there can be a mystery. Somethingt sparks an interest in one child, and not in another. The goal can't be about the kids getting a ham license, it has to be the benefits they might get from being involved in the hobby. And there are all kinds of things that might provide similar benefits, and might suit the kids more than spending time preparing them for a ham license. The effort might be better spent on getting them interested in something that fits them, and letting that be a vector for learning.

Too often, adults forget what it's like to be young, and they use adult notions in trying to interpret the young. So often there is the "kids today aren't interested in science" yet if they aren't given the chance they never will be. And of course, science was never something belonging to all. Building that regen receiver and getting it working should be as much of a challenge and thrill as it was back when I was young, because it's not about having the receiver (which won't compare with something store bought) but that you built it yourself.

I threw together a stepping motor, diode, "super-cap" and LED to make a crank flashlight a couple of months ago. I'm still trying to remember where I put the other supercaps I took out of VCRs, because there wasn't enough capacity. But I was making it to show the daughter of a friend, who is about the right age to appreciate that such things are in the realm of making yourself. It doesn't matter that you can buy such things pretty cheaply now, it matters that it conveys that such things don't just grow on trees.

If we aren't doing this sort of thing, conveying that we are intrigued by such things and showing off how it's not a black box beyond our control but something we can put together from scrap parts, then there's no chance that the young will become interested in science and technology.

The CK-200 Keyer features a Curtis 8044 ABM Keyer Chip with adjustable
weight and tone, volume and speed controls, and dot-dash memories

The CK-200 manual (Adobe Acrobat) on the Vectronics web site -- is DAMAGED.
Please contact Vectronics directly concerning this issue.
http://www.vectronics.com/manuals.php

eHam.net reviews of CK-200
http://www.eham.net/reviews/detail/1131

Here is the 8044 Application Notes - by John Curtis (circa 1992)
This should get you 90% there - since most designs were based upon John's notes!
http://users.ox.ac.uk/~malcolm/radio/8044screen.pdf

8044ABM. This final keyer chip was introduced in the spring of 1986.
It incorporated selectable A or B modes and the speed meter.
This truly was a top of the line chip, and became an industry standard.
However, as microcontrollers debuted in the '80s and PIC processors in 1990s -
the Curtis chips were no longer in demand. John stopped selling them.
MFJ / Vectronics purchased the 8044 line and now offers an improved 8045ABM.
Curtis ceased operations April 1, 2000.

We did extensive testing with APRSPoint on the new Vista OS, so far
all functionalities worked with no problems. The usb/serial
converter(IO Gear GUC232A) we used is also accepted by Vista using its
XP driver. Vista seems to have good backward compatibility, and the
interface looks nicer. Visit http://www.aprspoint.com for more details.

The "Little Joe" is actually Wes Hayward's W7ZOI Universal QRP Transmitter.

Go here for parts and schematic: http://www.qsl.net/k0kp/hbrew/qrp_tx.html

As for part two, in comparing the two datasheets, I don't see all that much that is similar between the two other than they are both NPN. You could try it though. If it doesn't work, a handful of PN2222's can be had for less than a couple of bucks.

Someone has asked my magazine column where the name "hybrid coupler" came from; and why do some people reserve the name "hybrid" for only certain types of couplers?

That isn't as easy a question as it first seems. Everybody seems to talk about "hybrids" but few authors are prepared to define exactly what it means - much less explain why.

The following is a draft outline for my magazine article. It looks much more authoritative than I actually feel about the subject - especially about the origins of the term "hybrid", so I would welcome any comments...

Hybrid is originally a biological term for a "cross-breed" that inherits different characteristics from two different kinds of parents. The word has then taken on a much wider sense - for example, we talk about "hybrid road vehicles" or "hybrid analogue/digital systems".

However, a "hybrid coupler" is a much more specific term, which came from the early days of landline telephony. Originally, a two-conductor line could only be used in one direction at a time; but with a hybrid coupler [Figure] at both ends, that single line can be used for full duplex communication in both directions. An important feature is that the coupler provides isolation between the links in opposite directions [insert more description here, including bidirectional amplifiers].

So why was this device specifically called a "hybrid" coupler? There's nothing particularly hybrid about the coupler, so my best guess is that the word originally applied to the communication link - the bidirectional offspring of two unidirectional parents. But in the strange way that technical language evolves, "duplex" has become the common word for a bidirectional link, while "a hybrid" has come to mean the coupler itself. The same word has then been applied to RF couplers that share some of the characteristics of the original telephone hybrid.

The best descriptions of RF hybrid couplers I've been able to find on the web are in:
http://en.wikipedia.org/wiki/Power_dividers_and_directional_couplers
and:
http://www.rfcafe.com/references/electrical/directional%20coupler.htm

In RF engineering the name "hybrid" has become attached to the 4-port coupler in [Figure]. When ports 2, 3 and 4 are matched, the input power at port 1 is divided equally between ports 2 and 3, with a phase shift of 90deg between the two output ports. Since half the input power appears at each output port, the transmission loss to each individual port is 3dB, so this device is sometimes called 3dB coupler. The reason why this device is called a hybrid is because of the port-to-port isolation it provides. In the matched condition, ports 2 and 3 are isolated from each other, and port 4 is isolated from port 1. [Add more details of the 3dB/ 90deg/quadrature coupler configuration.]

However, the Wikipedia author(s) also point out that nowadays "any matched 4-port with isolated arms and equal power division is called a hybrid or hybrid coupler." This wider definition also includes 0deg hybrids and 180deg hybrids, in addition to the original 90deg variety. Some 3-port devices are also called hybrids because they provide isolation between the output ports and have a 'virtual' internal 4th port, an example being the Wilkinson 0deg power divider.

Of course, some devices that do not meet every part of the above definition may still be called "hybrids" in practice. And a device that offers port-to-port isolation is likely to have other names as well, eg it may be called a "bridge". Are we confused enough yet?

Originally all these definitions were also restricted to passive linear devices, but as op-amps get faster and faster, and move up into the RF domain, it becomes possible to create the same port-to-port behaviour using active devices. It is now possible to build active hybrids that can operate up to at least 100MHz, and their advantage over transformer-based hybrids is that they have no lower-frequency limit. However, any hybrid still has to be a linear device.

[More to add...]

How does that look, as a first draft? I would particularly appreciate comments on the probable history of the word "hybrid" in telephony and electronics.

One possibility is http://www.shfmicro.com/ (in USA)

They have only the microwave modules, not the rest. Currently the
website shows only varactor-tuned units, while SOLFAN's are nominally
only mechanically tuned. These are more expensive than the simpler
units more commonly used in door openers or intrusion alarms. Their
stock varies from day to day.

You can build yourself a regen out of literally junk box parts. Direct conversion is a step up and not much harder. The micro R2 is even nicer.

> But that still doesn't solve my need for a ham band(s) receiver - to
> use as a receiver and as a necessary piece of test equipment.

If you are looking for "the ultimate receiver as a first step" then homebrewing is NOT for you.

> I know that the Drake 2b is good. But how easy (and cheap) is it to get
> one? Are most "wore" out?
> I've heard that a common ailment is that the mechanical filter will be
> screwed up.

They weren't talking about the 2B then. The 2B is LC filtering throughout. It's nice for the era.

> What are some receivers to look for (don't say the Collins - I don't
> have enough money)?

The new $100 shortwave receivers with a BFO will get CW and SSB OK. Not spectacularly well.

Again, you seem to be struggling with both building your first receiver, and making it the end-all-and-be-all-receiver that you'll never need another one. Those are largely incompatible goals.

You can build yourself a little QRP transceiver for a smallish amount of money. Will probably only cover one band and only the CW section, but that's OK.

You can buy an older all-ham-band (well, pre-WARC) transceiver for circa $100-$200. Might take some tweaking/cleaning, but that'll be good for you to learn. Will do CW and SSB just fine, maybe even AM and FM too if you want that (of very marginal use for most ham activities).

Test equipment on the used market is outrageously cheap. You could set yourself up with a dual-channel scope and a frequency counter for $200 real easy, less if you shop around. This sort of stuff would've been unobtanium to a ham in the 60's or early 70's.

Tim.

The only mechanical filters that I have seen problems with are the Japanese units that you find in the JRC receivers. There is some sort of foam that deteriorates over the years. I haven't seen a problem with Collins filters. Receivers don't "wear out". With an older receiver, however, it's a good bet that you will have to replace the electrolytic caps and replace all of the carbon composition resistors that have drifted up in value over the years. I took a different approach....................years ago, I also couldn't affort the top end receivers so I learned how to design my own high performance units. It was quite a learning experience, and it is a good way to go. This experience has landed me a few high paying jobs in the field. Give it a try!

All good answers. The main reason I was not going to build a Micro R2
was not the building but the single band.
I wanted something multiple band and as to frequency readout I was
thinking of adding a digital dial.
This guy has a neat (and cheap) frequency counter:
http://www.foxdelta.com/products/fc2.htm
And the shipping is only $5 to the US. (Haven't bought from him yet or
before, BTW).

Yes, I'm trying to maximize my purchase but I don't expect it to do

everything. And I probably should just bite the bullet and build
something but I'd like to have something commercial to fall back on.
This maybe werid reasoning but I'm trying to stay away from a
transceiver because I don't want the transmitter part. I want to try
and build my own transmitters and transceivers.
My first big project plan is to build a BITX20 SSB transceiver. I've
had a blast on 20 meter QRP SSB.
I've built an antenna tuner (Hans Summers' site) and I just finished a
KD1JV 'Tenna Tuner' - that's how I found out my frequency counter was
shot. It was given to me a year or so ago and I had never really used
it.
I also have a Softrock 6.x 40 M receiver I just finished but haven't
tested yet and a Micro 80 XCVR in the same boat (Micro80 is a Russian
Pixie type rig). I also have a AMQRP DDS60 on the bench but haven't
started it yet.
I have a RF signal generator (old Heathkit), two o'scopes but both are
low bandwidth, one is an old Tektronix solid state 3", 4 MHz BW and the
other is some dual trace that is like 5 or 10 MHz - but frankly I don't
remember how to use them correctly. I have a DMM, an AADE LC meter (I
love this thing), some odds and ends single board stuff I've built.
As one of you said, I need something to listen to the oscillator
with... But I'd like just a tad bit more.
Could I really get by with a newer digital dial SW receiver? I thought
they were just too wide open on the front end side to be any good at
all.
I have been eyeing the Drake R4 series... But that's probably more
liquid cash then I have.

Please keep it coming. I learning and asking questions. And some of it
is really starting to make sense!! :-)
---
On the receiver I've put messages on eHam and QRZ for a 'receiver
wanted' - I have some P4 class desktop machines I could trade, but I
haven't gotten any nibbles at all yet. I've been hesitant to put the
same message on rec.radio.swap due to the volume of traffic there.

But this goes back to the previous thread.

It's far better to build a single band receiver well, and get it working, than to deal with the issues of multiple bands.

But, that receiver will work all over the place, with some changing of frequency sensitive circuitry. One of those R2 receivers is even set up for using modules to change bands.

One of the points of building a receiver that tuned a fixed range, and then putting converters ahead of it, was that you could build the main receiver, and use it immediately, and then deal with adding the other bands.

I've often felt it makes lots of sense to make a good receiver, minus the frequency selective elements, and then put it into a good box. Put the "variable oscillator" in a separate box, so you can have a simple single band VFO to begin with, or even a crystal oscillator for a fixed frequency, and get the receiver going easily. Then you can work on the fancier wide range synthesizer, or go through various iterations. The basic receiver is always available, and so is the fallback variable oscillator, which is not the case if you need to put the receiver on the workbench to make some modification.

Now that broadband techniques have come to amateur radio, your "black box" receiver can keep the frequency selective elements outside the box. You can play with plug-ins for the desired bands, or something that switches the LC circuits. Or both, migrating from the simple to the complicated. You might find that on some bands that are less important to you, you can get by with a simpler front end filter, but other bands you want something fancier. If you build a receiver all in one box, and the ultimate is the end goal, then you don't have the chance of having the receiver relatively early, and you don't learn from the experimenting. Plus, your ultimate standards have to be there across the bands, rather than applied selectiviely.

Ray Moore wrote an artilce in Ham Raido magainze about 1973 or '74 about receiver design, and showed off what was to him his "ultimate receiver". But it was a broadcast band receiver, which few of the readership would be interested in. He was merely using it as an example. His point was that it's easier to build a really good receiver for a dedicated task than to build a general purpose receiver that does everything well. He mentioned that commercial receivers were often a series of tradeoffs because they needed to provide something to a wide range of buyers, yet then people are often paying extra for features they will never use.

Starting with a "black box" provides a lot more flexibility than when putting the frequency selective elements in the box.

It doesn't even have to be the R2. Get a good passive mixer, a decent SSB-bandwidth 9MHz crystal filter (or build one), and then build up a good basic receiver that doesn't work without added circuitry. ANd use that as the "black box".

I'm playing with a homebrewed receiver design and need a LO which covers 120 to 240 MHz. What's the feasibility of using something like the MAX4545 to electronically switch the ADF4360-8 VCO's inductors in order to cover that range? What other approaches are recommended for a homebrewed digitally controlled LO which covers that range?

John,

We were just having a similar discussion on sci.electronics.design, although
it was about switching in capacitors on the ADF4360's L1/L2 pins rather than
different inductors. One of the comments -- from Michael Terrel -- was that
he's worked on equipment that shorted out inductors at various taps to change
ranges. You might get some ideas from reading the discussion:
http://groups.google.com/group/sci.electronics.design/browse_thread/thread/
af76d133a6069080/f1cdc83a3cf9a3d5

One problem with the ADF4360 is that the DC bias is, of course, ground on both
ends of the inductors so the RF swings above and below ground, thus requiring
either fancy bias arrangements or devices such as MOSFETs or PIN diodes that
will conduct on both cycles with a single-ended control voltage.

<john@feith.com> wrote in message

Well... the tuning range is 1.2:1, so you'd need at least 4 -- probably 5, more practically -- switched inductors to cover the range. I suspect you could make this work, although the "grounded tapped inductor" approach is probably a little cleaner.

> What other approaches
> are recommended for a homebrewed digitally controlled LO which
> covers that range?

DDS chips! (E.g., AD9858.) The main drawback is that they consume significantly more power than a VCO/PLL combination and none will directly synthesize frequencies much above the low UHF range. But for 120-240MHz on mains-powered equipment, DDS would work well.

Where are you at, Cental Europe? If so, then the front end is too wide open.

If the middle of the US, then there's not much problem. If it becomes a problem, just put an attenuator in front.

The user interface on the new digital dial SW receivers is univerally sucky. They do awfully bad at "tuning around the band looking for a QSO", they are really built around the concept that someone will want to listen to Radio Netherlands at 15735kc and just punch in that number and expect to find it. There might be a tuning dial but it feels more like you're dialing through channels than tuning up and down the bands. The filters are only middlin' for AM, and will be "too wide" for SSB or CW on the ham bands if things are at all crowded. But contrasted with a $250 receiver from the 1960's they have a lot of nice things that were purely pie-in-the-sky back then!

> On the receiver I've put messages on eHam and QRZ for a 'receiver

Lots of stuff goes through E-bay. Including the general coverage receivers you seem to desire, for example I got a WJ-8716 (something that was almost entirely out of the reach of a non-millionaire ham in the 70's or 80's) at a tiny tiny fraction of what they originally sell for. Still not "cheap".

If you like CW, I have recently become very enamored of the Heathkit HW-16. There's a lot to be said for simple single-mode limited-bandwidth receivers (or in the case of the HW-12 transceivers). Break-in on the HW-16 with a couple mods is seamless, it's so good that I FEEL like I can hear even when I have the key down.

Spring is coming and there will probably be some hamfests near you. Hamfests tend to be better than say 10 or 15 years ago, when they were all computer junk. Even if you don't buy, you get to see and usually touch the stuff.

Tim.

(ADF4360 L's don't appear accessible?)
Done a bog standard, single transistor Colpitts, that covers 110-220Mhz
using a cheap SMV1255-000 varicap. It's part of a BFO arrangement and
intentionally limited to a  110MHz swing (1.5 to 4.5V) but there's a bit of
steam left in the Varicap and 120-240 seems not unreasonable. Present plan
is to feed the VCO to a LMX2306 synth run as always, by a PIC.
(BFO design started after rooting round for a now unobtanium  /100 frequency
count prescaler for another project and noticed the cheap LMX2306 can act as
all things to all men ).

What's the power consumption of the VCO? (I'm looking at breaking apart one of those ADF4360's into a separate VCO and PLL, since the 4360's use a *lot* of power, but apparently most of this is tied up in the VCO since you can readily get PLLs that are only a milliamp or two such as your LMX2306...)

2ma at 5V.
It's a 2N3819 fet with 1k5 source. Runs about 300mV rms (or, as this is a
radio group +2.57dBm :) For curiosity, the original fet circuit seemed not
unhappy to be pushed to 500MHz, (on plug in breadboard!).
Noticed the "-7 -8" ADF4360 versions use external Ls. Nice feature (to me)
is that the oscillator is routed internally to drive the DivN counters. At
the moment am using 2 MMC's to give a 1Vrms (apologies, +13dBm) final output
to drive other circuits, ALC and the synth but they burn power like there's
no tomorrow.

That's a Kv of about 36 MHz / V.   Naive question ... doesn't a higher
Kv
have the potential for greater noise? What is the effect of a higher
Kv
for the LO VCO on the overall performance of a receiver?

I can understand using a MOSFET to short an inductor at various taps,
however
I don't see how to do that using a PIN diode unless DC blocking
capacitors are
being used between the inductor sections.

You already know the names to look for: Kenwood, Icom, Yaesu. Most names from the past are either junk by modern standards, or are expensive collectors items. You're already on the air, so *talk* to people. Hell, maybe somebody has an old but still useful radio they're not using. You'll never know if you don't ask.

There are indeed used professional receivers out there. You will get an astonishing radio if it has a name on it like Watkins-Johnson or Harris (two names that have shown up in this thread), but just because they're less than they were new doesn't mean they're cheap.

My advice: buy something decent, but don't fret too much over just what it is. Once you have some experience with whatever you end up buying, you'll have a standard for comparison, and will know what to look for.

You asked about software radios? (I abhor the term SDR) Buzzword city, ultra-trendy, but I'd be surprised if 1 ham in 100 really knew how they worked. Get it right, though, and a software radio can do things no hardware radio could dream of doing.

I looked at this chip some time ago for use as the LO in an HF receiver, and I abandoned it concluding that the noise performance of the VCO is about 20 dB shy of the minimum you need for good HF receiver overload performance ('reciprocal mixing").

As to the VCO tuning range, less is usually better from a noise standpoint, as most varactors don't have very good Q specs and the tighter the varactor is coupled into the overall resonant circuit, the poorer the resonant Q will be. Also, high tuning sensitivity in the VCO makes the oscillator susceptable to modulation from 'junk' on the power supply or the tuning voltage.

Shorting out turns in the resonant inductor as a means of bandswitching isn't so great either, as the shorted turns inductively couple into the resonant circuit as resistors (the resistance of the pin diode or other switching element), lowering the circuit Q and raising the noise of the oscillator.

In general, it's best to band-switch discrete elements such as separate inductors or capacitors and to keep the tuning sensitivity as low as possible in order to provide continuous coverage of a band. If high tuning range is necessary, every attempt should be made to use high Q components and to maintain a high loaded Q in the circuit they're used in. Also, parallelling of varactors has been shown to improve noise performance in wide-range oscillators.

I spent about a day's salary on my WJ-8716. I contrast that with the
stuff I had thirty years ago and that's dirt cheap :-). In constant
dollars I spent way less on the WJ than on my HW-100 back then.

That said, I have a lot more fun with simple one-mode ham-band-only (or
a few-ham-bands or one-ham-band) receivers. The most fun ARE just a
step or two removed from the most simple. While the filters on my HW-16
aren't nearly as tight as those on the WJ-8716, the receiver of my
HW-16 feels MUCH more like a "window on a slice of the 40M CW band".

> Once you have some
> experience with whatever you end up buying, you'll

A decent older ham-band transceiver is a fine place to start. Lots of
radios from the 80's on are also general-coverage receivers.

My advice is to not only listen and use and look "upscale", but look
and try out "downscale" too. Some steps down will be too far (for
example, I really do not enjoy direct conversion receivers although I
appreciate much of their simplicity) but some other will be "just
right".

Tim.

Speaking of the dentist, I visited the dentist yesterday and quizzed the
hygienist
about her glasses with the special lenses mounted out front. She said the
had a
magnification of 2.5 and focus length around 18". Always thought I wanted a
pair of those but 2.5 magnification doesn't seem like enough and she
reported
the cost as $800.00. The dentist had a flip down style that mounted to his
regular
glasses. They cost less but still expensive.
                                         Mike

I should have said that the TV camera was mostly for the education and
amusement(?) of the patients, and to allow images to be captured for the
records. For his own use, my dentist has exactly the same kinds of
flip-up compound lenses that give a reasonably magnified view from a
long focal distance. This allows him to sit more upright and avoid back
strain.

Such lenses would be fine for SMD work too, because they would give us
an unobstructed work area, and would reduce back and neck strain for us
too. But as you say, they are low on magnification for our needs, and
very expensive.

People's eyes and preferences vary, so there's no one 'best'
magnification. Personally I find x10 is plenty for SMD, and might even
trade down to x5 for a system that gave me more clear space to wave the
soldering iron... and of course if the price was right.

why not kill 2 birds with one stone?
for about $200.00 u can get the The Electroluminescent Receiver Kit
http://www.pan-tex.net/usr/r/receivers/
its a kit that is designed to be a teaching platform and the pads are large
enough to allow for multiple remove this and try that type mods.
$60.00 of that price is a digital read out.

sorry, I forgot this part:
http://www.pan-tex.net/usr/r/receivers/elrconstruction.htm
the "General Information About the Boards" is what sold me on the unit
there is so much info all scattered about on that site that it took me a while
to find that part

Hi Joe,

That's some really good information; thanks. One question...

-- If shorting part of an inductor to ground is not that desirable since the PIN diode or other switching device will have finite resistance that'll create noise, isn't there the exact same problem with switching in multiple discrete devices? That the switching device will create a little noise?

---Joel

You got a bargain, and I'm envious. My RF-590 cost more
than my car, though that's not saying much. :-)

I made up for it with my 51J-4 (oops...sorry...it's a Collins!),
which I got for hauling it away.

> That said, I have a lot more fun with simple one-mode ham-band-only (or

The HW-16 is one of the great radios, and is an excellent
example of how simple a radio can be, and how well it
can work. I had one for a while, but it kept frying the QSK
switching transistor. :-(

There is an enormous amount of choice out there.
If you (the original poster) come across anything
that looks even remotely useful, grab it.

Sam, I have looked at this receiver a couple of times. The price is
quite attractive and I would get to build it to boot. I was just a
little skeptical.

Have any of you built one? Does it work well?

It sure looks like a hoot to build and use.

He also has a 'basic' one band receiver kit as well. Don't remember
much about it.

Hi group

I am looking for an digital controlled variable gain amplifier with BW > 200MHz.

The amplifier had to have min. 256 steps and should be used in an 50R system therefore impedance match on in- and output are preferred. Max output power 10->20dBm.

I can�t find any integrated amplifier there match these requirements. My best choice is AD8368 http://www.analog.com/en/prod/0,,759_787_AD8368%2C00.html and then use a DAC for the digital control.

Have I missed some? Any suggest will be appreciated very much

Thanks in advance

Frank

Hi All,
I recently bought a new Wagon R car.
has anyone experience of fitting 2 metre transceiver/aerial to this vehicle
. I am particularly wary of any problems that might arise with the engine
management system etc.

sorry, I forgot this part:
http://www.pan-tex.net/usr/r/receivers/elrconstruction.htm
the "General Information About the Boards" is what sold me on the unit
there is so much info all scattered about on that site that it took me a
while to find that part

Are you refering to a strong signal acting as a local oscillator and
when mixed with the phase noise sidebands of the actual local
oscillator
producing results which fall into the IF being used?

The phase noise performance of the ADF4360-8 is listed as -120 dBc/Hz
at 100 kHz offset from carrier. The MAX2620 which I was also
considering
is listed as -110 dBc/Hz at 25 kHz offset from carrier. What did you
end up
using and what are the specs?

Does attenuating the signal before injecting it into the mixer help
avoid this problem?

I use these:

http://www.harborfreight.com/cpi/ctaf/displayitem.taf?Itemnumber=38896

Also, I've soldered literally hundreds of fine-pitch SMD ICs using the simplest method of all: just bridge all the pins with solder and wick off the excess with solder-wick. Never had any problems with residual solder bridging or whiskers of solder-wick. You folks have made a mountain out of a molehill on this subject.

Hi,

My objective is to homebrew a 10khz to 60Mhz software defined radio; one that uses the power of the PC for all modulation and demodulation functions. There are several references for a direct conversion receiver that uses a sample and hold detector or Tayloe detector which seems to provide remarkable performance. If possible I would like to use this detector; it embraces the KISS approach ;-). The problem I find however, is that the detector responds to odd harmonics of the receiving frequency, for a doubly balanced configuration. ;-(As an example, if the receiver is tuned to 10 Mhz, a signal of 30Mhz will also be received. Using Linear Technology LTspice (which is a free spice type simulator) to simulate the detector, the

30Mhz signal is about 10db lower then the 10Mhz desired signal. Looking for 140db or better difference; have a long way to go. Possibly there is an error in the simulation; but I think, unfortunately, it is correct. After all, the switch function is not linear. A Fourier analysis of the switch pulse closely agrees with the detected result; the third harmonic is about 10db lower then fundamental. Does anyone have experience with this type of detector?
Thank You.

The odd harmonic response is typical for switching mixers.

If you want to avoid the odd harmonic response, you should either filter out before the mixer (e.g. octave filters as used in many receivers) or use a true linear four quadrant multiplier and feed it with a pure sinuous local oscillator signal.

However, the noise and distortion performance for a practical linear four quadrant multiplier may be worse than a switching filter with octave preselector filtering.

Anyway, some preselector filtering would anyway help the mixer handle the input signal power and use different attenuators/amplifiers for different bands. For VLF/LF/MF and lower HF you might need some attenuation, while for the upper-HF and lower VHF, you might need a preamplifier.

If direct conversion is used, quite a lot of AF amplification may be needed, so for the upper bands, it would make sense to use some RF-amplification ahead of the mixer to distribute the gain between RF and AF frequencies.

I would suggest using some switchable band filters and a programmable attenuator if you really want to make the receiver usable and not just demonstrate that it can tune the specified frequency range :-).

Well I thought it over for a long time as well.....
Then I met David, WN5Y one night on our regular Sunday night Echolink QRP Conference. After a long discussion with him I decided to try one. How well does it work? I'll tell you when I finish it. <g> I am maybe 1/4 of the way through building it.
Is it a fun build, absolutely!

I put the ELR (Electro Luminescent Reciever) assembly on the back burner while I built the m3 digital LCRZ meter http://www.m3electronix.com/lcr.html I figured it would be a handy tool for what ever mod I might wish to try on the ELR unit. So I'm just now getting back to building it.

After building that little LCRZ meter it was a real pleasure to get back to the ELR's large boards and discrete components.

I will say that I have had the occasion to need to ask David a couple of questions along the way and he has always been extremely helpful. He is even open to questions not only about the actual assembly, but is also willing to bounce around queries about modification you might be considering to the unit.

My reason for the choice of the ELR was......
I have a TS430S that I had to send off to get it fixed. Not only did I not have the equipment to fix it, I didn't have the knowledge. About $250.00, 2 months, and 2 trips back to the shop) a return trip for something that wasn't fixed the 1st time around.

After all that, I decided I wanted to learn how to repair what ever rx and tx I bought/built in the future. So I figured if I built it, I just might learn enough along the way to be able to repair it. Since my favorite bands are 40m, 30m, and 17m the ELR was exactly what I wanted.

I'm sure enjoying the build and if I don't like it's performance (which I doubt will be the case) It's designed with the wider pads so that I can play with it and try out this, that, or what ever mods I think could make it better. Ever tried that on a board with those tiny traces and smd components? I'm not that comfortable with the dead bug or manhattan styled building, maybe later after I begin to understand theory well enough to try something from scratch. And the huge plus that the guy who sells it, encourages me to correspond with him about any mods and he is happy and willing to help me out with them...... Can't beat it as far as I'm concerned. Sorry for rambling on, I'll just close with the comment "try it (I really think) you'll like it"

God Bless,
KA5OAI

Hi, has anyone got a copy of the articles for the Chatterbox Top Band
rig which were published
some years ago in Practical Wireless that they could email to me ?
I had a complete set but lost them due to a disk crash and a corrupt
back-up.
Thanks.

http://www.datasheetarchive.com is another good one. They have 5x more
datasheets than datasheetcatalog even if a bit slower.

Use ADL5330 in combination with a log amp. You can control the ADL5330 with
an ADC.

As extra bonus, you achieve a very nice automatic level control.

Tired of listening to Led Zepplin or NPR on your I-Pod?   Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

RSS FEED: You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.
http://www.soldersmoke.com/soldersmoke.rss

If you don't have an MP3 player you can just go to the
site below and listen to the latest program (and
earlier editions) using the audio software on your
computer.

http://www.soldersmoke.com

All our programs are available here.

We hope you enjoy the program. Please send us
feedback.

73 from London

I have an old Collins filter made for the R390 series receivers. It is
a cylindrical filter with two pins at each end for connections. I can

hear something rattling around inside this filter as I tilt it from side
to side. Has something deteriorated inside this filter or is this
normal? A later rectangular Collins filter does NOT make this noise.

I don't think a noise is normal.

But, it's always possible that they can be dropped.

The issue Pete is talking about is that those Japanese filters were
made with different materials, and they decay with time.

My filter has never left the original Collins packing (heavy cotton
lining in a large cardboard box) since I got it at a hamfest years ago
(for a project that never happened). I remember the filter seemed ok
when I bought it, and it was NEVER dropped (by me anyway). Years later

when I found it while packing for a move I noticed it developed this
sound when handled.

I have several Eimac 8877's I bought as tested new-equipment pulls
around 5 years ago. I tested them again myself at the time, then packed
them away.

Here it is 5 years or so later. The question for the panel is how long
should I "cook" the filaments before putting plate voltage on?

Thanks,

Jim, N7CXI

I don't think that the tubes will go bad just sitting on the shelf for 5
years, they should work the same as the last time they were used.
Having said that, it is always a good idea to wait until the cathode
reaches full emission before applying plate voltage and rf drive.

I would think that these tubes reach that point within a minute of
applying filament power.  You could apply filament power to the tube on
the work bench and monitor the tube temperature.  With the tube out of
the socket and heater power applied via use of heavy clip leads you can
feel the base of the tube with your hand and see how long it takes to be
able to feel the cathode heat reach the outside of the bottle.  (It
won't be hot, just luke warm).

Thanks Roy and those who have responded.
I did just that, I found a willing assistant who cut off some pieces for me
and after measuring them I found that our Series 1PVC is equivalent to the
USA std of Schedule 40.
Regards,
John

Hi, gang:

Just moved into a "Townhouse" and am now stuck with doing the invisible antenna thing... I need some insight. Please read:

My 4-plex has four side-by-side units, each with a ground floor plus an upstairs (plus a hard-to-access upstairs attic space). Looking at things from the backyard, my unit is on the left. After thinking about various solutions for a few months, I decided that the cheap-n-dirty approach was to load up the 75-foot horizontal run of seamless gutter, which runs from east to west. It's about 22 feet above the ground and runs the length of the common roof line. My shack is on the ground floor about 15 feet from the left-hand downspout. With me so far?

To keep things sneaky and to get a better electrical connection to the seamless gutter, I crawled out the bedroom window onto the garage roof...and used a stepladder to climb onto the main roof (yes, at night, of course!). Surviving that, I used an electrical "fish wire" to drop an 18-gauge insulated wire to ground level INSIDE the downspout. Up top, the wire runs horizontally inside the gutter for about 15 feet, where the peak of the garage roof (easy access) puts the gutter at eye level. At the "feed point," about 15 feet into the 75-foot horizontal run, I sanded off the protective coating on the inside of the gutter, drilled a small hole for an 8-32 stainless screw and attached the antenna wire via a soldered lug. I cranked everything down tight and sealed it with silicone for WX protection.

At ground level, the downspout sits a couple of inches above my side door patio slab, so I positioned an empty outdoor hose reel/box to the left of the spout (looks natural and doesn't draw any suspicious glances). Inside the hose box is my SGC autocoupler, which is connected to the wire coming out the downspout (can't be seen without a microscope) and a 1/4-wave counterpoise for each band from 80 through 6 meters. The counterpoise wires, made from 24-gauge enamel-covered motor wire, are bundled together and run around the foundation slab to the north and are hidden by the decorative rock that circles the condo, etc. Also buried in the rock and butted against the slab is a 25-foot run of RG-8X coax, bundled with a length of the same wire I used for the antenna (to power the autocoupler). The downspout is essentially in the center of the building on the north-south axis. The counterpoise goes north and bends around the building to the east while the coax runs to the south and enters the attached garage just above the floor slab. (I converted the attached garage to my office/shack.)

Okay. So I have a 95-foot inverted-L, with 22 feet being vertical, the rest horizontal, worked against a counterpoise system. Not a Steppir Yagi at 200 feet...and not a horizontal loop at 50 feet...but better than a sharp stick in the eye...

QUESTION 1: The downspout has several angled, press-fit sections and, under these circumstances, I'm always worried about nonlinear rectification. Do I connect the bottom end of the downspout to the antenna wire at the autocoupler level...or do I let the antenna wire float inside the downspout...knowing that they're electrically connected (via press fit junctions) to the seamless gutter up above? If I don't tie in the bottom of the downspout, will it "shield" the wire inside or act "strange" with the autotuner? And what about nonlinear rectification? I can only connect the bottom of the downspout. The upper angles and bends are essentially inaccessible.

QUESTION 2: I can optionally run a second pair of counterpoise wires to the south (40 meters and up - no 80), but the wires will have to be bundled with the RG-8X coax, which runs to the shack. Could there be any potentially bad interaction between the second set of counterpoise wires and the feed line? Coupling? Inductance? RF in the shack hassles? And if that's NOT an issue, is a second set of counterpoise wires going to make a noticeable difference in antenna performance?

I mostly run 100 mW to 10 W, CW and RTTY/PSK. I sort of planned to avoid SSB in case I'm messing with someone's clock radio down at the other end of the building :) I'm in the process of trying to find an IC-703 or an Argonaut of some sort (sold all radios a year ago...long story), but if I can only acquire a 100-W rig, I might be tempted to run 100 W on rare and desperate occasions (to work the Sultan of Bhutan, or whatever :)

SUGGESTIONS? COMMENTS?

All are welcome, of course!

Thanks.

I wasn't concerned about them going bad per se, just tiny bits of gas
released from the inside not getting 'getted' and causing a flashover
when plate voltage is first applied after long-term storage.

It seems that any time I fire up an Eimac ceramic triode after it's been
sitting a long time it flashes over once just to spite me and stress
the supply. Maybe it's just bad luck or other operating practice on my part.

Well effective sometime in Feburary, 2007 you won't need code to get
the highest class of license. See?

My crystal ball saw this a coming.

Whatever you can get to work - just do the best you can. I was in the same situation in a condo, although I was on the 3rd floor. I tried loading the gutters, but got very poor performance. I ended up with just a 30' run of 26ga enameled wire run from the bedroom window out to the eaves under the balcony, and that worked great. But I was running a Drake C-Line (this was in the year 2000) and had lots of power. I worked all over the US and some DX on 40 and 20, with a Kenwood TS-180 manual tuner. QRP would have been a very different story. I only run CW, so didn't have any experience with SSB. I'm sure I was lighting up something in the building, but never got complaints (of course, no one knew I had an antenna!) and only ran late at night on 40 and in the middle of the day (when folks typically aren't watching TV or even at home).

If you get a good sharp dip at resonance with your tuner, you will probably not have a lot of interference problems. But if the tuning is 'mushy' and very low Q, watch out! You're probably not getting out, and just swamping the house with RF. Be sure to employ a good LP filter as well.

I wouldn't expect much QRP performance, especially at 100 MW!

Just give it a go and see what happens.

Dave WB7AWK

Personally, I would put that effort into the HPSDR project -- which benefits
all (open source) and expands your total education.

Hey, OM:

If I remember correctly, in the late '80s / early '90s, Phillips made
an in-dash AM/FM/SWL/Cassette car radio. Always wanted one. I'm sure
there are still a few lurking out there.

Hey...just checked. Here's a Sony car stereo that covers SWL bands,
too!

See it at:

www.shortwavestore.com/sws/product.php?productid=595&cat=42&page=1

Nifty!

Jim, I would suggest a bit more than a minute or two.. You may want to pop that question over on rec.radio.amateur.amps and get the group opinion... I would suggest a 24 hour filament preheat after long storage... There is no more effort in letting it cook 24 hours than for 3 minutes...
I have no direct experience with the 8877 but I do speak 4cx800... The majority of the amp builders getter new tubes with filament heat only for up to 24 hours before applying HV.... One of the failings of hams is that we seem to think that turning on the filament is wearing out the tube... Whereas the broadcast industry turns the filaments on and leaves them on because they know what wears out the tubes is cycling the filament from cold to hot over and over...

I just finished bringing a 3CX1200D7 back to full output with a controlled filament over voltage for 6.5 minutes with no HV applied...

cheers ... denny / k8do

They used to be popular in Europe where SW broadcasts were commonly used as sources of news and entertainment. There may be many models still available there. The problem with using them in the U.S. is that the AM tuner will not work properly as the stations are 9kHz apart instead of 10kHxz, and the FM stations will sound different.

I doubt that anyone driving in a car would notice the difference (it's due to how the high freqencie sounds are processed) and the tuners may be set or modifed to 10kHz spacing, or tune in 1KHz intervals.

73,

Geoff.

Checked out your link, while interesting this is not my project's direction.
The fun is designing the entire project from concept to the finished
product.

The particular Sony model I mentioned tunes in 9 or 10 kHz steps on the
AM BC band. It's obviously meant for use on either side of the
Atlantic... :) Wish I owned one!

This is much too vague to give a specific answer. Are you looking for an UPS from a specific company? Do you intend to build one? What type of output do you need? What load will it drive? How long a time? Have you tried a search engine to find the info?

hi,

if you are trying to repair one it is hard to get the schematics,
ups co. want to sell you new units and trade in your broken units.

we need more info.

It's also important to bring heaters/filaments of large tubes up to
power SLOWLY!. In the old days, they'd use a variac (with a large
knob!) and slowly bring the voltage up so the heater/filament wouldn't
be shocked by the sudden inrush of current. In a dual 4-400A amp I
built years ago I just put a large resistor in series with the primary
of the filament transformer and shorted it out with a relay after 15
seconds delay. (Used a transistor and an RC circuit to control the
relay). After the the filament was on full power another circuit on the
relay removed an interlock on the relay controlling the HV power supply.
There was also a resistor in series with the plate transformer that was
shorted out by a relay (the coil of that relay in parallel with the
primary of the plate transformer). This limited the inrush current to
the filter capacitors to protect them and the rectifier diodes.
There were TWO power switches, on for filament and one for plate, plate
power could NOT be applied until the filaments had full power.

4-400A's being directly heated, come up to power rather quickly.

As for the flash over in those ceramic metal tubes, maybe some trace
radioactive elements in the ceramic has something to do with this?
If you don't believe it, bring a Geiger counter near the tube!

No, it's just the result of very slow outgassing from the metal and ceramics.

To handle this problem, all vacuum tubes are constructed with some kind of 'getter', a chemically activated surface that combines with stray gas molecules and keeps the vacuum clean. In small glass tubes, the getter is the silvery metal film (usually barium) deposited on the glass, but such metals are too volatile for use in transmitting tubes.

The getter used in transmitting tubes is a metal such as zirconium or tantalum, which needs to be hot in order to function. In large glass tubes the main getter is typically the dull grey coating on the outside of the anode, which is intended to run very hot. In addition, there are often secondary getters in cooler locations such as the grid and heater/filament structures. However, the anode of a metal/ceramic tube is always quite cool, so the main getter has to be in the hottest place available, typically on top of the cathode post.

All this means that transmitting rubes need to be *used* in order to keep the vacuum clean. Tubes that haven't been used for a while may need to be fired up with heater/filament only, to give the getter a chance to function before high voltage is applied. Cooling is also required, of course. How long this takes will depend on the individual tube, but 24 hours is usually enough to reduce the risk of high-voltage flashover.

Just to be clear, a leaky seal is a completely different problem. Outgassing is typically worst with brand-new tubes, but will eventually settle down. In contrast, a leaky seal is continuous. Although the getter may be able to handle a very tiny leak for a while, the leak will eventually win.

To whom this may concern,

The ARRL has now entered a new facet for technology here on Google Groups. In fact it has entered it twice. The ARRL and The American Radio Relay League are just two more google groups which have popped up in the last several weeks which are both itching to gain members. The ARRL groups are both set for Amateur Radio members who wish to join in on the action with real pros on familiar terriotry. Memebership unlike the real thing is free on both counts and they provide the same services that the real ARRL provides. Keep in mind that they are both brand new but soon they will be as advanced as the real thing and maybe better.

73 and thnaks for listening,
Javier Anderson, KC2MFC

I want to build a power meter for the hf bands that has maybe three scales: something like 0 to 1 watt, 1 to 5 watts and 5 to 25 watts. I

had one I built for 1-5 watts one time and remember it was easy
measuring across a voltage divider resistance network. Can't find the
schematic rite now.
I enjoy working qrp and it would be a useful asset in the shack.
I also might want to add a circuit to it for attenuator since my rig
only goes down to 5 watts.
thanks and 73

do a google for the "stockton power meter" or "stockton swr meter". If
you can't find it then I'll send you a PDF of the article.
It should cost about $20 including meters...

Does anyone , preferably in the South East England still have a Creed
Teleprinter 7 in workable condition?
It does not need to have power unit etc.
I am doing voluntary work for a local Heritage Site and they would like a

teleprinter on show so that the young visitors can see how such a complicated mechanical device works.

Pete,

Too bad you're on the other side of the pond. I have a WWII Model 19 composite set with tape punch & reader that's been sitting in my basement for years. I'd give it to someone who could come pick it up.

Joe

W3JDR

I was surfing the net and found a reference to an unusual low phase noise LC VFO that uses two inductors. Unfortunately it seems I forgot to bookmark the site. Can anyone help?

Thanks,
Larry Lobdell Jr.

Well, I think I'm just going to go with a modern, portable SWL receiver for now. There are several very interesting models that are quite cheap. New prices are about $150 for the newest and best of them.

I appreciate all the input and encouragement. I built my first 'Manhatten' constructed circuit this week - a VFO for the BITX20 transceiver. The good news it oscillates, the bad news is not at the right frequency or the right spread but I've got an online buddy helping me out and if nothing, I got off of dead center. I'm just excited that it worked at all - AND - that I understand most of it and how it works. I'm pretty sure I will understand it all before I'm finished.

If you're intersted the radios I'm looking at are the Eton E5, Sony ICF-SW7600G & GR, Degen/Kaito DE-1103 and a couple of other oddballs. Hopefully I can snag one off of eBay.

Thanks again.

Dan KB9JLO

Hi. Ages ago I started to build this radio and did complete it 99%, but never used it. I'm now going to add the finishing touches and use it. At the time I remember feeling unimpressed with it. Just sounded horrible I thought. Anyway, if anyone made this radio or is currently using it, can you please get in touch. I think talking to someone who made this Rx might be helpful. TIA.

My email:

hobby_electronicsGETRIDOFTHIS@ntlworld.com

Please reomove GETRIDOFTHIS.

I wonder if anyone of you have a circuit of this Transistor tester
which my friend has
and could send a scan to rus_kinjatyahoodotcodotuk
for me to pass on
or know where I could find one.
Thanks.

Larry, Have you tried looking at your history in your browser? It
probably remembers where you were. If you recognize the URL from the
list if you see it, just click on it and away you go.
If you are using Internet Explorer click on the little clock with the
green arrow on it to get to your history list.

Rick K2XT

Dirk was on the West Coast when he got the call. An old friend at the Toronto police department thought he would like to fly up and take a look at a homicide which had occurred the previous evening. He decided to skip the last day at the World Holistics conference and take the next plane out of San Francisco.

The flight was bad; Dirk had been hit on the back of the head by the Newspaper trolley, the drinks trolley, the dinner trolley and now the gift trolley. When the hostesses weren�t trying to tear his arm off they pestered him to stop leaning into the aisle - ignoring the fact that the guy next to him was taking up one and a half seats. Air Canada used to be the flight which was so good you just didn�t wanna get off - on this occasion Dirk would be glad to see the back of the plane and the over sized alternative comedian wedged into the window seat.

After breathing in a couple of lungfulls of crisp Canadian air Dirk took a taxi into town. There was a small group of demonstrators outside the MacDonalds and the taxi driver insisted on stopping on the opposite side of the street. �Don�t Eat Meat� the placards read and the demonstrators chanted. A couple of policemen where stopping the crowd entering the restaurant itself - one held up his arm and challenged Dirk. A wave of the fax he had been sent and the policeman pushed open the door.

There were few customers in the restaurant. Not surprising really with a demonstration going on outside, half the dining area roped off with tape and a dead body seated at one of the tables. �Mr Gently sir� the officer in charge called out as he peeled one end of the tape off a column �We were told not to touch anything til� you got here�.

The body of the man slumped awkwardly in a chair. Then even a dead body would start getting uncomfortable in a MacDonalds chair after twenty minutes - and this one had been there for at least eighteen hours. Two back legs and the tail of a cat hung out of the man�s gaping mouth. Dirk turned to the officer, �I suppose you are going to tell me this is the darndest thing you ever saw?�

�Ain�t this the darnd...�. The officer seemed annoyed that Dirk had second guessed him. �We�re removing the body in a few minutes, so if you can get through as quick as possible�

�Many people eat cats in fast food restaurants?� Dirk asked and without waiting for an answer leant over the table to pick up an untouched burger. �And what�s this?� he asked waving it in front of the officers face.

�It�s a Vedgie Burger� The waitress, who was cleaning one of the adjacent tables, shouted across. She walked over to Dirk. �We started doing them because of that lot out there� she nodded towards the protesters who were pressing there faces against the windows �They�re called Linda McCartney Vedgie burgers - ever heard of them?�

Dirk suddenly felt faint, perhaps a combination of hunger and jet lag. �This is deja vu all over again� he thought to himself. He glanced at policemen - at the badge on his shoulder �OPD� but this wasn�t Ontario this was Toronto. OPD - Officially Pronounced Dead. It dawned on Dirk what was happening, he knew what he would see if he looked out of the window. Sure enough, there it was, the Volkswagen Beetle parked across the road - number plate 28IF - 28 IF Paul McCartney had lived. And amongst the lyrics of the song blaring out into the restaurant he could pick out the words �I buried Paul�. Now it was though Dirk was viewing the whole scene though a TV screen. This was conspiracy. Not -a- conspiracy, or -the- conspiracy, but just plain conspiracy.

�You look faint - are you OK mister? The waitress asked.

Dirk shook his head �Probably a bit hungry� Then to economise on dialogue took out a pack of cigarettes and held it out towards the girl. She was about to take one but Dirk snatched the pack away, held it up to his mouth and drew out two cigarettes. He lit both then passed one of them to the girl. It was the closest he had come to a sexual encounter in three months.

�Want a Burger?� the waitress asked.

Dirk looked down at the Vedgie Burger on the table. �No thanks - just a plate of fries�

The waitress walked away and Dirk looked around the room. Apart from a family seated in the far corner there was only one other person in the restaurant - and he wasn�t eating. The guy was about mid twenties and had straggling, shoulder length hair. On the table in front of him were lots of pieces of paper cut into squares. Every so often he would pick up a camcorder and pan it around the room and then, when he was finished, speak into a microphone which was attached to a tape recorder. Dirk walked over to where the man was sitting.

The small pieces of paper had paragraphs of text written on them and were stuck to the top of table with blobs of mustard. Lines had been drawn, some solid some dotted, on the table top with a marker pen. The lines ran from one piece of paper to another.

�What are the lines for?� Dirk asked, realising straight away that �What the hell are you doing?� would be more appropriate.

�You see� The man replied nervously �The dotted lines are weak links and the solid lines are strong links. The dotted lines are things which are happening in the rest of the world and the solid lines are things which are happening to me. Now you see I draw over a dotted line, replacing it with a solid line, when I can link something back to me. Like this� The pen squeaked over the Formica and before Dirk could interrupt the man added. �You see I lost my short term memory and, as a consequence have a very short attention span. I write down, record and film everything then put it all together later�

�So� Dirk interrupted. �You filmed what happened here?�

�Yes, yes, it�s here on this tape� The man pushed the cassette across the table. On the label the words �Grassy Knoll� had been crossed through and replaced with �MacDonalds�.

Suddenly the man sprung from his seat. Dirk turned and saw that the body was being removed on a stretcher. As it passed the man picked a small object off the edge of the stretcher itself. �This is important� he said, laying a blood stained bullet on one of the small pieces of paper on the table.

Suddenly the room was filled with a deafening throbbing sound as a Black Helicopter landed in the street outside. Two men in United Nations uniforms got out and collected the stretcher. Back at the table the long haired man was replacing all the dotted lines with solid ones. Dirk panicked and began to walk backwards at some speed. Barging through the swing doors he stumbled into the kitchen, tripped and felt himself sink slowly into a large vat.

�The guys fallen into the batter� Dick heard someone shout before he sunk below the surface. He came to sitting in a chair with the batter solidifying all over his body. He surveyed the room through two eye-holes someone had cut. Suddenly the chair on which he was sitting was picked up carried through the restaurant and out of the building. As the chair was being lifted and put into the back of a van, Dirk caught a glimpse of the waitress following him. �Your fries mister, your plate o...�.

The doors of the van shut and Dirk tried desperately to steady himself as it sped across town. Eventually the doors flew open and Dirk was flung into the road at which point the solidified batter shattered and set him free. Standing up he found himself outside the international departures terminal of Toronto airport.

In the departure lounge Dirk had time to reflect on the day�s events. He had got caught up in the conspiracy theories and the haphazard welding together of pieces of irrelevant information. It was time to catch the person who was operating the bizarre cognitive engine which appeared in front of him like a fairground mirror, distorting any flaw it could find in his own, fragile, map of the real world.

Dirk leant into the aisle of the plane as it took off for London. The oversized person next to him swung his arms violently as he complained about every thing from the supper in a plastic tray to the state of British politics. With a shaven head and a badly fitting suit the man looked as though he could have worked behind the reception desk of the Kremlin. However when he spoke he did so in a Liverpudlian accent. �Me I blame the Con-serv-a-tive government, me. The Tour-rees. That-cher. Me. They need a good kicking� He jerked his feet forward and struck the seat in front with his Doc Martins. �With these. Me Doc Martins. Doctor Martin�s, Doctor Martin�s, Doctor Martin�s Booots!� The phrase was now being sung over and over again as the man writhed in his seat and clicked his fingers.

Dirk looked down at the boots and thought of the reaction most people used to deal with the paranoids at the end of the wire. A nice quick kick. �Oi nutter - get some therapy�. This is the easy way out and perhaps the safest. After all there you are sat, alone, in front of the screen. No body language between you some paranoid. No way of telling if he really is some gibbering psycho. Look at it too long and you be drawn in. Fall into the tangled database of weird links with him. Who knows he may be watching you, reassembling and linking your experiences with his. How sure are you of you own cognitive threads. After all cognition is only a bug fix for a neurological system which was designed in a hurry - it�s abused by everyone from politicians to advertisers. If people really can convince each other that a bottle of washing up liquid is as exciting as an orgasm using just television God knows what they can do with a computer. Better to avoid the risk. A swift kick. After all if you�re Homophobic you put the boot in because you are scared of any ambiguity in your own sexuality - why not be Nutterphobic as well.

Although Dirk would have liked to devoted time to tracking the culprit down he decided to let it rest. The Internet changed over the next twenty odd years. A lot of the people who used it went out and got lives. And those who already had lives burnt them away. The number of users had dwindled after someone had invented a C++ program, with truth as a variable, to deal handle politics and government. Dirk had already retired from finding old ladies cats with the help of obscure science when he got another call from Toronto.

It was 4th March 2025 when he booked onto the Air Canada flight from Heathrow. The silver haired woman in the seat next to him painted bright red lipstick around her mouth. �Of course it was no surprise to be offered the job after Claire Raynor retired� she sneered� After all I used to be a psychiatric nurse... Now if Blokes had periods they would understand...�

By chance the taxi ride to Toronto mental hospital took him past the MacDonalds - where the whole thing had started. Of course it was barely recognisable having become a Church Of Scientology Vedgie Bar. Police in riot gear kept the two sets of demonstrators apart. Dirk didn�t really know what to expect when he got to the hospital. The girl at the reception desk directed him to a row of chairs in a wide well lit corridor. There was a strong smell of disinfectant, the furniture and the carpets were immaculately clean and behind the rows of teak veneer doors the �nutters� were all safely locked away. For some reason Dirk started thinking about CompuServe forums.

A tall blond woman in a white coat approached. �Mr Gentle, I assume�

�Yes� Dirk replied shaking her by the hand. �You�re the nurse who...�

�Doctor� She interrupted, �Doctor Killfile� She led Dirk across the corridor towards one of the doors then stopped with her hand resting on the handle. �Now you know about this person don�t you?� and after Dirk nodded she continued �Don�t tell him anything about yourself - don�t let him get into you head. If he does he�ll screw it up�

The door opened to reveal a frail man sitting in from of a TV screen. He had a keyboard on his lap and next to the television was a computer screen. Dirk glanced at the walls of the room and remembered that his settee at home need upholstering. The nurse left the room and the man looked up �So you come to my daughters wedding and ask me to kill a man� he said in a dry cackling voice. �Look� he continued, pointing at the screen, �I know that man. They�re talking about me now - listen�. The man stared at Dirk. �What�s your name? Are you one of my friends from the Internet? - Are the lambs still screaming Dirk?�

Dirk, at first recoiled in horror, then felt a sense of anti climax. So this is what they hyped up to superstar status on the back of their own fears of madness. Dirk was reminded of the film �A day on The Beach� where a submarine had set off to search a post nuclear World to track down a signal coming from a remote military base - only to find it was being sent by a Coke bottle half balanced on a Morse tapper. Outside the room the nurse waited for him. Because his nicotine craving had returned - and to avoid an awkward piece of dialogue - Dirk turned to her and asked . �Patch?�

Dirk took two nicotine patches from his wallet the first of which he stuck onto the inside of his arm. Stepping closer to Doctor Killfile he opened her white coat and slid his hand into the opening at the front of her dress. He pressed the patch onto her leg as close to the top of her inner thigh as he dare. She took a deep breath and then slowly breathed out. �What Bogart could have done with these things� Dirk thought to himself.

�Is he crazy?� Dirk asked tilting his head back to towards the door.

�Who knows� Doctor Killfile replied �We let him type away. He sees something on the TV in the morning and it keeps him busy all day. What he types doesn�t go anywhere it just stays on a mainframe in the basement. It can be read by anyone else in the building but that�s it. We got them all in here conspiracy theorists, racists, nationalists. They�ve created a world within a world really...� Her voice trailed away and she stared down the corridor for a while then added �So long are two things are different neither will come to be in the other and so become at once both one and two.�

Dirk gave her a puzzled look �You mean their brains are
fried?�

�Fried?� Killfile smiled at Dirk �No that was Plato�. Then the
smile fell from her face. �You must remember, mister, plate
o...�

Mike Corley FAQ
version 0.1
first edition 5th May 1996

last updated 5th May 1996
Iain L M Hotchkies iain@XXXXX.demon.co.uk

Mike Corley is a 'net personality' who has been active on the following newsgroups (uk.misc,uk.legal,uk.politics,uk.media,soc.culture.british) since....? Well, at least as far back as the summer of 1995.

He posts long tracts, the tone of which approximates that which one might expect from a reasonably intelligent paranoid schizophrenic.

No details are known of Mike's 'real' personal life or background. Once would presume that he came from a reasonable family and was reasonably well educated before the first symptoms of schizophrenia began.

Schizophrenia: Clinical features
(from the Oxford Textbook of Psychiatry, 2nd Edition)

The acute syndrome

Some of the main clinical features are illustrated by a short description of a patient. A previously healthy 20-year-old male student had been behaving in an increasingly odd way. At times he appeared angry and told his friends that he was being persecuted; at other times he was seen to be laughing to himself for no apparent reason. For several months he had seemed increasingly preoccupied with his own thoughts. His academic work had deteriorated. When interviewed, he was restless and awkward. He described hearing voices commenting on his actions and abusing him. He said he believed that the police had conspired with his university teachers to harm his brain with poisonous gases and take away his thoughts. He also believed that other people could read his thoughts.

This case history illustrates the following common features of acute schizophrenia: prominent persecutory ideas with accompanying hallucinations; gradual social withdrawal and impaired performance at work; and the odd idea that other people can read one�s thoughts.

In appearance and behaviour some patients with acute schizophrenia are entirely normal. Others seem awkward in their social behaviour, preoccupied and withdrawn, or otherwise odd. Some patients smile or laugh without obvious reason. Some appear to be constantly perplexed. Some are restless and noisy, or show sudden and unexpected changes of behaviour. Others retire from company, spending a long time in their rooms, perhaps lying immobile on the bed apparently preoccupied in thought.

The speech often reflects an underlying thought disorder. In the early stages, there is vagueness in the patient�s talk that makes it difficult to grasp his meaning. Some patients have difficulty in dealing with abstract ideas (a phenomenon called concrete thinking). Other patients become preoccupied with vague pseudoscientific or mystical ideas.

When the disturbance is more severe two characteristic kinds of abnormality may occur. Disorders of the stream of thought include pressure of thought, poverty of thought, and thought blocking. Thought withdrawal (the conviction that one�s thoughts have been taken away) is sometimes classified as a disorder of the stream of thought, but it is more usefully considered as a form of delusion.

Loosening of association denotes a lack of connection between ideas. This may be detected in illogical thinking (knight�s move�) or talking past the point (Vorbeireden). In the severest form of loosening the structure and coherence of thinking is lost, so that utterances are jumbled (word salad or verbigeration). Some patients use ordinary words in unusual ways (paraphrasias or metonyms), and a few coin new words (neologisms).

Abnormalities of mood are common, and of three main kinds. First, there may be sustained abnormalities of mood such as anxiety, depression, irritability, or euphoria. Secondly, there may be blunting of affect, sometimes known as flattening of affect. Essentially this is sustained emotional indifference or diminution of emotional response. Thirdly, there is incongruity of affect. Here the emotion is not necessarily diminished, but it is not in keeping with the mood that would ordinarily be expected. For example, a patient may laugh when told about a bereavement. This third abnormality is often said to be highly characteristic of schizophrenia, but different interviewers often disagree about its presence.

Auditory hallucinations are among the most frequent symptoms. They may take the form of noises, music, single words, brief phrases, or whole conversations. They may be unobtrusive or so severe as to cause great distress. Some voices seem to give commands to the patient. Some patients hear their own thoughts apparently spoken out loud either as they think them (Gedankenlautwerden) or immediately afterwards (echo de la pensee). Some voices seem to discuss the patient in the third person. Others comment on his actions. As described later, these last three symptoms have particular diagnostic value.

Visual hallucinations are less frequent and usually occur with other kinds of hallucination. Tactile, olfactory, gustatory, and somatic hallucinations are reported by some patients; they are often interpreted in a delusional way, for example hallucinatory sensations in the lower abdomen are attributed to unwanted sexual interference by a persecutor.

Delusions are characteristic. Primary delusions are infrequent, and difficult to identify with certainty. Delusions may originate against a background of so-called primary delusional mood - Wahnstimmung. Persecutory delusions are common, but not specific to schizophrenia. Less common but of greater diagnostic value are delusions of reference and of control, and delusions about the possession of thought. The latter are delusions that thoughts are being inserted into or withdrawn from one�s mind, or broadcast� to other people.

In acute schizophrenia orientation is normal. Impairment of attention and concentration is common, and may produce apparent difficulties in remembering, though memory is not impaired. So-called experiences result from illness, but usually ascribe them to the malevolent actions of other people. This lack of insight is often accompanied by unwillingness to accept treatment.

Schizophrenic patients do not necessarily experience all these symptoms. The clinical picture is variable, as described later in this chapter. The table below lists the most frequent symptoms found in one large survey.

The most frequent symptoms of acute schizophrenia (World Health Organization 1973)

Symptom	Frequency (%)
Lack of insight	97
Auditory hallucinations	74
Ideas of reference	70
Suspiciousness	66
Flatness of affect	66
Voices speaking to the patient	65
Delusional mood	64
Delusions of persecution	64
Thought alienation	52
Thoughts spoken aloud	50

Various theories exist about Mike Corley:

1) he exists and is disturbed and has net access and for reasons uncertain spams a selected number of newsgroups on a regular basis - if you are reading this FAQ then you will almost certainly have seen one of his posts.

2) Mike Corley is a 'virtual schizophrenic'. Mike displays the relevant features so well that some people think he may be a construction of one or more people with intimate knowledge of mental illness and the mentally ill. Perhaps they wish to monitor the effects on the internet of the posts of a schizophrenic. Moving into X-Files territory a bit, ourselves, here.

Mike's posts attract different responses:

1) cruel, humourous, dismissive posts from those who've seen his posts many times and have become generally irritated by his behaviour while accepting that he probably has a mental illness.

2) posts from Corley-newbies - those who have come across relateviely

few of Mike's posts. These may be humorouous or disbelieving.

3) posts from people who have been sucked in (for one reason or
another) into Mike's Wild & Wacky World (TM)

That's enough for now.

Thanks, Ian. That's a very clear and concise description of the issue.

This may be overkill, but since it costs nothing I'm thinking of four six-hour cycles, allowing the tube to cool to room temp or so between cycles.

Since you're here, Ian, I'll slip in an unrelated question. What do you think about using regulated DC for the heater on an 8877 ? I ask because I'm thinking of using a couple of spare controller I/O pins and a home-made R2R network to ramp up a series-pass regulator as part of the overall controller startup.

On the other hand, I suppose a relay and appropriate power resistors would be simpler... ;-)

Thanks,
Jim, N7CXI

Persecuted by the Security Service

Since June 1990 the British security service MI5 has waged a campaign of harassment against a UK citizen,
through the broadcast and print media, verbal abuse at work, and molestation in public and during travel.

Despite widespread knowledge of the campaign in the UK and discussion of its characteristics on Usenet for
over three years, it continues today both in Britain and North America. Its cause and basis is xenophobia
on the basis of the genetic accident of mental illness, coupled with discrimination against an inferior
"foreigner" whom they condemn as "not up to British Standards".

If this is your first visit to this site, please read the FAQ first. Feel free to contact the author with
any questions.

Frequently Asked Questions article outlines the parameters of the persecution. Who

is involved, and why?
What technical and social means do they employ? What response have I made, and why has their campaign yet
to be exposed?

The UK Security Services which are believed to be behind it all. Domestic security is the province of MI5
while the secret intelligence service MI6 combats foes (and its former employees) on foreign shores.

Usenet archive chronicling the (sometimes very enthusiastic) exchanges which have taken place on UK-local
newsgroups since May 1995. Make your mark on the continuing discussion!

Believe it or not, a few items of evidence have been recorded. Although none of them is particularly
conclusive, by presenting them I hope to explain what I understand from some television and radio programmes.
Most of the "clinching" material was aired in 1990-92, and no recordings exist now, which is quite unfortunate.

My complaints to the BBC and MI5 (via the Security Service Tribunal and Interception of Communications Tribunal),
and their response to my challenges, are recorded here. Basically they deny everything, they have put their
denials (mostly - Buerk and Lewis refused) in writing, and I don't believe them. Part of the website also
documents media coverage of my campaign to expose the persecution.

Faxed articles to, and responses from British organisations including Parliament and UK media. Over 24,259 faxes
in all were sent from 1998 to 2000. Their aim was to boot discussion of the persecution into the public domain,
and that aim was not accomplished.

20,000 Reward Offered to Expose the Conspiracy

I am making a pledge for information directly leading to the exposing of the "BBC
Newscaster
Conspiracy". The exposing would specifically need to lead to a legally binding
admission from Martyn Lewis
or Michael Buerk of the BBC they they were watching me through the TV set.

I would be happy (delighted, in fact) to pay GBP 20,000 sterling in reward for the
above admission.

So if you use your linear often you only need to heat treat the tubes
once, on installation.

===========================
On some if not most  european continental amateur radio fleamarkets
cut-offs up to 1x1 ft are often sold by weight.
I have a healthy stock enabling me to also homebrew  enclosures.

Is this material not available from surplus traders frequenting North
American hamfests & fleamarkets ?

That's the sort of answer I would have given, but I wondered if it was a trick question.

"Large area" suggests something really big, but if someone isn't familiar with what is available, then "large" might mean something more than a few inches.

In 35 years, I've never bought blank circuit board new. Starting with wretched board that cracked when you cut it and the copper came off when you soldered to it (but it was "surplus" and cheap at Etco Electronics back then), and then buying it at hamfests, and then the remaining old school electronic store here in Montreal (Addison Electronics), blank circuit board of all kinds of thickness and sizes and single or double sided has always been readily available.

You're right, it can usually be had so cheap that it is a great thing to use for enclosures. Unlike plastic, it's can provide shielding, but it's also a lot easier to work than equivalent thickness metal. I've been known to strip off the copper and use the bare board when I need to make up some mechanical gadget, it being so easy to work with.

Addison often has board that has been drilled for some production work, but not etched (or even had resist applied), which is even cheaper. I can cut around it for small pieces, or if I'm just using the board for soldering to, the holes aren't even noticed.

For the original poster, the Radio Amateurs of Canada have a website at http://www.rac.ca and they keep a list of upcoming hamfests, so it's easy to watch for one coming up nearby. Though, it's really the off season and I doubt there will be many until the spring.

Jim Barber wrote:

>Thanks, Ian. That's a very clear and concise description of the issue.
>
>This may be overkill, but since it costs nothing I'm thinking of four six-hour cycles, allowing the tube to cool to room temp or so between cycles.
>

What would be the reason for dividing the 24 hours into four parts (bearing in mind that the 24h is already little more than a guess)? Also note that the tube must be cooled anyway, to avoid overheating of the base seal. 5V at 10.5A is a lot of heat input, and all of it must be removed somehow.

>Since you're here, Ian, I'll slip in an unrelated question. What do you think about using regulated DC for the heater on an 8877 ? I ask because I'm thinking of using a couple of spare controller I/O pins and a home-made R2R network to ramp up a series-pass regulator as part of the overall controller startup.
>
>On the other hand, I suppose a relay and appropriate power resistors would be simpler... ;-)
>

There are two separate issues there: the need for a regulated heater supply; and the need for a slow ramped startup.

The need for a regulated heater supply depends on the regulation of your mains voltage. Eimac specify +/- 5%, so if your mains regulation is worse than that, a separately regulated supply could be worthwhile. Mostly you need to prevent the heater voltage dropping too low, because electron emission from a chilled cathode may not be able to deal with the peak anode current.

If you ever plan to use the amplifier from a Field Day generator, then the answer changes to a definite "yes". Otherwise you can get a nasty scenario where you switch to TX, the increased demand pulls the generator voltage down, and the heater voltage along with it... and then you're trying to pull peak anode current from a chilled cathode. With two or three stations sharing the same generator, there will frequently be a "double low" or "triple low" when stations are transmitting at the same time. You can't do much about the effects on anode voltages in this FD situation, but you can prevent unnecessary stress on the cathodes by regulating the heater voltages.

As it happens, the 8877 has a 5.0V heater, and low-cost 5V switch-mode supplies are very readily available. A PC power supply would do, but is much larger than needed for an 8877 (10.5A). Nominal 5V power supplies can generally be modified for other voltages in the 5-6V region by jimmying the master voltage divider. Switching noise should not be an issue if you choose a supply that is shielded, and filtered at both input and output.

But this raises an issue related to your second question. It is not normally necessary to avoid prevent inrush current surges with *indirectly* heated tubes such as the 8877... BUT... a voltage-regulated heater supply MUST be modified to prevent it from driving a very large current into the low resistance of a cold heater at startup. I haven't tried this personally, but some people have created a ramped startup by simply adding a large electrolytic capacitor across the right half of the master voltage divider (you can check this using a 6V light bulb).

By the way, I learned a lot of this stuff by reading the mail on the AMPS list over the years (http://lists.contesting.com/mailman/listinfo/Amps). There are also searchable archives.

ok, I was not precise. I am an amateur. What I am looking for is
getting copper board for less than what digikey is selling.

When I say large, 12"x12" is large enough, even smaller. I think the
keyword is "cheap", not "large".

I used to buy (in Eorope) large sheets (by weight, i.e. cheap) and then
cut the sizes I wanted. (where large is defined as approx 1m x 1m).
Here in Canada, I could not google up anything similar.

p.s. I am in Ottawa, ON

Thank you!

Cohen's on Merival had a bunch real cheap.
I'd check it out and while your there check
out Computer Recyclers on McFarland they might have some too.

Digikey's prices are good on a lot of things, copperclad isn't one of them. Almost anyplace would be cheaper. If you don't have decent hamfests up there, you can find plenty on the other side of the border.

I generally pick up most of mine at the Findlay, Ohio fest, a bit of a hike for you, and probably not a large enough fest to make it worth the trip. I go every other year and a two year supply generally costs me around twenty bucks.

Dayton is worth the trip, and if you are a builder, then the QRP conference FDIM is well worth the trip all by itself. For copperclad, though, you need to be quick at Dayton. Even though there is an amazing amount of stuff there, the decent deals on copperclad are often all gone by the middle of the day Friday.

Unfortunately I was having issues with IE so I ran Norton Clean Sweep
last weekend. It solved my problems with IE, but wiped out all the
info in the IE History folder.
Oh well...
Larry

On the subject of copper clad what is the best way to cut it into the sizes one need? I would assume using it for constructing boxes would be pretty time consuming using hacksaw and files. Short of a full size bench saw is there anyother lower cost/ smaller size electric saw that would work well with CC ?

Thanks Larry

A bench shear is a wonderful thing for cutting copperclad. I have a relatively inexpensive small brake and shear from Northern Industrial Supply that also comes in handy for making boxes. It is a little small for some things, but I just plain don't have the space for a full size model. Even fairly large shears aren't all that expensive if you have the space.

```

I want to make a modification to my FT-1000D that involves bringing the QSK switched receive coax lead to the back panel (adding a RCA phono jack). I want to unplug the inter-board coax cable that runs from J7208 (on the LPF unit) to J1005 (on the RF unit) and leave the original coax in place. I want to make my own cable that runs from J7208 to the new RCA jack on the back panel. I could just cut the original coax and use it, but I want the option to back out of this modification if I don't like it.

I have coax cable I can use. I need the tiny coax plug that goes on the end of the cable. The plug is a crimp-on style and very small. It is keyed and only fits into the circuit board jack in one orientation. The circuit board jack (which I don't need) sticks up off of the board at a 45-degree angle.

I thought I would just order a spare cable from YAESU and use it for my modification. I contacted YAESU. They don't have a part number for the cable. They would have to build one from scratch at the factory in Japan and were unwilling to do this.

I have been searching catalogs but not finding the plug I need to be compatible with the jack on the LPF board.

Does anyone know what type of connectors these are and where I can get some?

Thanks - Jeff - KA9S

=====================================
To cut fibreglass or phenolic copperclad boards I use a carpet knife
(repaceable Stanley type) After carefully scoring (deeply) along a steel
ruler it breaks very neatly . Finish with a file or amaril paper .

Frank   KN6WH / GM0CSZ   temporarily in Torrance CA

Although I have not seen the plug, it sounds similar to what Ten Tec used in
the Omni VI series and probably others. Ten Tec is very helpful, you might
give them a call.

I have several dbm modules, most with sma but some with bnc and most have
the labels worn off. I suspect one might be HF and the rest microwave. I
have a Watkins Johnson with a blown mixer and need to replace it. I've
ordered a Minicircuits SRA-3H but no word as yet. How would I go about
testing these to find out if they're any good and good for VLF to 30 MHz?
It would be too hard to substitute them as the space is limited and I don't
want to risk buggering something else up. On some I'll have to determine,
in, out, osc and that mya be a chore if the unit bad.. Any tips on how to
determine the leads and test for performance appreciated.
tnx

Browsers usually only remember history of URL's directly typed in.  If a
site is reached via a link the browser won't save the history of it.

Andy writes:
  MSL normally has very good information in their catalogs regarding
the connectors, frequency range, and performance of their mixers.
  If you don't have their catalogs lying around, there are two more
possibilities... Do a google to find their website and they may have
everything on online.   Otherwise, call their customer service line and

tell them the info you need.... In my previous life, they gave
excellent
support...

    Good luck,

             Andy W4OAH, in Eureka, Texas

Most of my SMD work is done using half-moon reading glasses - the strongest and cheapest available from the drugstore - in front of my normal glasses. When not in use, they hang from a neck cord.

After publishing this suggestion, a very generous person *gave* me a professional-quality binocular microscope. This is wonderful for big jobs like assembling a whole new board... but to be honest, I still tend to use the double glasses more, because the "setup process" is much quicker.

You will find that the tip of the soldering iron becomes much steadier when seen under the magnifier. This feedback loop is a wonderful thing, especially if you give it the best possible chance to work:

- "Use the scope, Luke!" - learn to concentrate exclusively on what you're SEEING. This is harder than it seems, because for normal soldering we also rely a lot on our sense of touch, and automatically tend to press the tip of the iron against the parts being soldered. With SMD this is a disaster - it simply pushes the parts out of position - so you need to break that habit and concentrate on using ONLY your eyes.

- Steady your arm against the edge of the bench, so you're not trying to stabilize your whole body.

- Stay off the caffeine - it creates a fine tremor that the brain cannot stabilize (too much "noise" in the feedback loop).

In making FM transmitter distortion measurements, does anyone inject the 1 kHz audio signal into an FM transmitter by holding the microphone next to a speaker? It would seem that neither speaker nor microphone would produce enough distortion of a single frequency to affect the results, and in any case, the microphone is part of the system being tested.

The idea would be to avoid having to fiddle with the variety of microphone connectors out there.

I suppose I can and should compare the results of this technique with applying the audio signal directly to the microphone input terminal.

Appreciate any thoughts. TIA.

Chuck

Applying the signal to the microphone input terminals addresses just
part of a system, allowing you to point to the transmitter itself and
either say "that is a problem" or "that is not a problem".  Applying the
signal to the system as a whole only lets you wave a hand at your bench
and say "somewhere over there, there is a problem".

I'd check transmitter and microphone separately.  Then if they passed
and I'm feeling conscientious I'd check them together.

You know... I just happen to have two old floppy drives in my drawer.
Might be able to control them as they are through the standard cable if I
have the right software. Would just have to make another mechanical
modification to put the motion to use. A standard diskette might come in
handy for that. :)

Excellent idea! Thanks!

You have to control the levels so that the transmitter doesn't get driven into deviation limiting. Usually testing is done at 60% of system deviation. I am assuming this is a land mobile transmitter? Connecting a tone generator to the microphone terminals is best way to control the test.

The problem with a 10x microscope is first FINDING the soldering iron
tip in the field of view. If I am looking into the microscope and
trying to place the iron on the work often the iron ends up way in left
field (or I push it into my other hand OUCH!) TOO much magnification
can be TOO much of a good thing. I wish I had another set of eye piece
lenses (or an other objective) so I could go down to 5X sometimes.

My microscope is a true binocular with poro prisms and dual objective
and eyepiece lenses. It was a 'gift' from a former employer (they were
cleaning up the lab and threw it out). I did have to jury rig a stand
since only the optic head was found in the trash, the unit originally
mounted on a long spring loaded 'gooseneek', like those circleline
magnifier lamps. (One of the focus knobs is cracked in half, but I can
live with that).

Thanks to the several people who have responded already. They were sharp enough to copy & paste the original questionaire... with their responses... and send via email. Actually, I was surprised at some of the responses... but that's good. That means that my ideas for the feature list may not be mainstream. I'm looking forward to others responding so I can see trends as they develop.

Hello 2 all

I'm looking since a long time, a compagny that sells surplus microwaves doors openers (solfan modules or similar).

Any ideas ?

thanx & 73

Mike.(F03MM)

Thanks for the tips, gents.
Sounds like a binocular microscope would be a great tool; otherwise I
suspect depth perception might be an issue.

I'll keep an eye out for one.

It still is an issue, because a microscope prevents you from using one of the most natural ways of perceiving depth, by looking at the board from a few different angles. Only a head-mounted viewer allows this.

A large lens on a spring arm is a kind of half-way option, but it rapidly loses quality at off-axis angles.

Another problem that needs to be mentioned is focusing and depth of focus. With a microscope, you have to put down the iron or the solder in order to adjust the focus. With a head-mounted viewer, you simply move your head to re-focus... but by the end of the day you'll probably have neck strain.

Also we haven't mentioned lighting. All microscopes tend to suffer from poor light-gathering power, so the work area needs to be very brightly lit.

While we're on the subject, a friend has come up with yet another option. Like many of us, he has a very good detachable zoom lens for a 35mm camera that he doesn't use any more. He has fixed this onto a low-cost colour CCTV camera, and positioned it about 4 feet above the workbench, looking straight down. This gives a moderately magnified view of the work area on a TV monitor directly in front of him.

This has the big advantage of leaving the workspace completely unobstructed, so he can switch very easily and naturally between the monitor and the direct view. He reports that it avoids a lot of the eye and neck strain.

The main practical problem that he still has to solve is "camera shake", because of viewing from such a long distance. In his case, the camera is mounted from the roof of a wooden shack, so he can't do SMD work on a windy day.

If you have a suitable lens and a CCTV camera, this option would be well worth trying.

Try the dial knob just behind the mic gain, this should be the control to
adjust the power. CCW to decrease/CW to increase. 73' de aa8wl, Sam

Hello All,

I am soon to take my "tech" license test and would very much like my first contact to be QRP. I know that CW is not a favorite topic of conversation on most amateur radio newsgroups/message boards, but I find it a fascinating mode and am eager to learn it and master it.

At 60 years of age, it has been a challenge to master the little that I have learned.

Can you please post your favorite QRP/CW tutorial sites to assist me? I'm also looking for recommendations for a first QRP rig, new or previously owned.

Many thanks for taking the time to respond!

Alain

The definitive list of QRP links is at

http://www.qrparci.org/component/option,com_weblinks/Itemid,23/lang,en/

If you want to have so much fun it should be illegal, plan to attend the annual QRP gathering at Dayton

http://www.qrparci.org/content/view/1965/118/lang,en/

This is a pretty big effort for some folks, but between all the events over the four days, it is so much fun you just can't believe it. "They say" Thursday to Sunday, but actually the fun starts Wednesday evening, and it pretty well wraps up Saturday night. Friday and Saturday during the day it gets a little slow because some folks head over to some sort of thing at the Hara Arena, but the real fun is at Fairborn.

For information on Morse, especially about learning it well enough to make it fun, try

http://www.k7qo.net/

There is also some good building information on Chuck's page. Chuck used to have some excellent information on the Small Wonder Labs SW+ series of QRP rigs, any which are a very good choice as a first kit. One of the reasons it is a great first choice is the Elmer 101 site

http://epic.mcmaster.ca/~elmer101/

To learn about rigs, people's experiences, and to see what folks have for sale, the QRP-L reflector is the watering hole for most QRPers.

http://mailman.qth.net/mailman/listinfo/qrp-l

Beware ... this is a VERY BUSY email reflector. Unfortunately, you need to sign up to see the archives. There are unofficial archives elsewhere, but I don't have the URL.

This should keep your hunger for data fed for a while <g>

Now that has potential:

By pure coincidence, I already have a Sony HDR-SR1 high-def (1080i) camcorder and a 21" 16:9 LCD display with HDMI input in the lab.

Putting those two devices together and adding an appropriate macro lens would seem to be a natural thing for this kind of work.

Great idea, Ian!

Jim, N7CXI

One can find similar devices on the used market from time to time,
made for folks who are visually-impaired. My late wife left me one,
but it's up in Canada. I hope to retrieve it this coming summer.

Not my own idea, but a friend's. He particularly likes having the camera
a long way above the work, so the area in front of him is completely
clear.

Come to think, my dentist has very a similar system as part of his fancy
new workstation, which is styled like the bridge of the Starship
Enterprise.

I wish to extend my thanks to all who helped me with my question on
wireless video transmission for my project.

Besides the replies I received on this forum, I also received a number
of private email replies which gave me links to vendors, homebrew

sites, etc.

I now have a lot of 'absorbing' to do, so I will go about it.

Thank you all again,

Joe

I see there will always be those people that can predict the future. The No Code is just going to bring in Bank Robbers, Rapist, and thieves, Murder's. Wife beater's, And the MOB.

Come on grow up children. You learned the Code and that's just Great, but do you really really have to pick on those that didn't have too..... like they should be lower than life and feel dirtier then a used pair of underwear. You are not showing your Intelligent as little people. When you could be there to help them feel like they had joined up with a great bunch of people. What are you a big bunch of Whiners. Your sounding more like your mad you had to learn it,and your pi$$ed off that they didn't. You don't own the Hobby of Ham Radio!!!!!!!!!!!!!!!!! Your suppose to be the best part Of it. Not the worst part... Get a life your acting like it will be the end of the world.

Get involved in a real cause ,like people trying to take away your right's. Like the right to bear Arm's, and the right to live in a good and just community. And not one riddled with crime, and Murder. These are just good people wanting to talk on the Ham Band's.   Not everybody wants to be a Radio operator. The people that will come into Ham Radio will be people that enjoy talking on the Radio, and if they don't they'll leave and go on to newer and different thing's... Your just trying to be a group of elitist... You don't OWN HAM   RADIO PERIOD!!!!!!! Get over it Grow up and get a life. Do something get along for once. You don't have some big CLICK going on here. Anybody that can pass the test's is an OPERATOR!!!!

Tough Crap. It's a License to operate on Ham Band's. The same as it is to have a Driver's license to drive on the Highway's. You don't have a say in it. It's ran by the Government and that's that. Your just not going to be SPECIAL ANY MORE AND YOUR CRYING ABOUT........... STINKEN WHINER'S. What do you get if you put a Whiner on one end of a Teeter   Totter and a Queer on the other....... NOTHING !!!! Nothing neither one knows when to SHUT UP...

Thank You for letting me say my peace.   I know there a Great Hammer's out there. And you just don't hear them Bitching all the time.

I LOVE ROCK & ROLL. AND beautiful FAST woman Too.. HHHAAAAA   HAAAA You got to love it.. It's called LIFE.

Jimmie

You might try venturing out to your local hardware, plumbing, or DIY
store with a ruler. It's less convenient than surfing the Internet, but
there's no problem with finding the right URL. All you have to find is
the pipe.

Hey, a couple years back I had a QSO with a guy using a 49 MHz
Teenage Mutant Ninja Turtle walkie talkie, recrystalled for 6M.
He was getting out pretty well too.

Somewhere in my papers - I have an article that came out specifically
dealing with taking a "Space Patrol" type walkie talkie and placing it on "6
meters" as a QRP rig. I bought a pair to do it - and things got hectic. That
became a back burner project. I still have the walkie talkies but have to
dig out the paperwork.

Cecil,

Code "isn't" dead "completely", I think we all know that. I believe I am
safe in saying that what this guy was getting to was - SC's vigilance to
keep insulting No Code Hams OR Ham want to bes. There really IS no reason to
keep that up. There is nothing we can do to bring it back - the decision has
been made - whether we like it or not. Insults can only help "kill" the
hobby.

I've said it before, I'll say it again - if you like it - USE IT. If not -
so what!

The horse has been beaten to death - past death, now into the dust. Give it
a break. I've blocked all that have supported "his" stupid remarks and
argument. It has been going on for at least 6 months. IT IS OVER!

It shouldn't be that big a deal.. I know a lot of the newer ones are basically
one IC with a crystal for the transmitter and an RC tank for the receive, so
you'd have only two things to change.

"Space Patrol" looks good on a QSL card equipment line, but not as good
as "Teenage Mutant Ninja Turtles."

There was a group of us back in Boston in the late 80s doing that a lot ... we had a big bin of the xtals, and were tuning them up for a local 6m repeater.

I also had a simplex pair that I used to build a fun 2400 bps packet rig.

Imminently hackable, and amazingly cheap.

Good memories.

Yeah - the biggest deal of it was changing the crystal. I think the coils
and so on - were pretty much there within reason to oscillate. Been a while
since I read the article though.

>I also had a simplex pair that I used to build a fun 2400 bps packet rig.

This brings to mind... the military has lots of those horrible little AN/PRT-4A transmitters selling dirt cheap on the surplus market. They are kind of neat because they have a 455 KHz oscillator to shift the frequency of the crystal up, allowing you to use the same crystal for the transmitter as you did for the (seperate) receiver.

NOBODY has documentation on these things. The LOGSA database has them still listed as unavailable except within the military. Does anyone have a schematic on these?

As I recall, these were issued in Vietnam for communication within units, but were mostly famous for drawing fire with their large antennae and for poor signal quality.

Guys that was a great discussion...
But I still have a question or two. Well actually a lot more than that
but we can't answer them all.

I know I'm not ready to build my own receiver, unless I went the micro
R2 route (I'm going to build one some day).
But that still doesn't solve my need for a ham band(s) receiver - to
use as a receiver and as a necessary piece of test equipment.

I know that the Drake 2b is good. But how easy (and cheap) is it to get
one? Are most "wore" out?
I've heard that a common ailment is that the mechanical filter will be
screwed up.
What are some receivers to look for (don't say the Collins - I don't
have enough money)?

BTW, got the EMRFD for Christmas. I like reading it but I have a lot to learn...

Thanks,
Dan KB9JLO

And a related question: Folks made a lot of useful comments about hardware-defined receivers last round, but no one has mentioned software-defined ones. Are there any SDR's in existence that rival the best HDRs?

> I know that the Drake 2b is good.

Well, I used to have one and didn't think it was wonderful. The 4C is good, but now you're talking s-line money. Besides, as a lab instrument I'd have thought you'd want a receiver with accurate frequency read-out.

Cheers!
Jim, N5JRS (was K5YUT)

You are never ready to build your own until you bite the bullet and do it

> But that still doesn't solve my need for a ham band(s) receiver - to
> use as a receiver and as a necessary piece of test equipment.

If you want to use the receiver as a piece of test equipment (and a decent receiver can be a really great piece of test equipment) then you want a modern, synthesized, solid-state receiver.

> I know that the Drake 2b is good. But how easy (and cheap) is it to get
> one? Are most "wore" out?

The 2B was a great rig in its time, but that was back in another century. Almost anything recent, even real junk, will be better, and a lot less hassle. Sorry to the guys who wax nostalgic about the old hollow state gear, but get something hollow state if you like to be constantly maintaining it, if you like drifty, unstable, etc. Compared to other stuff AT THE TIME, the Drake was great. But any modern rice box will run circles around it. And rigs from that time are now getting old enough that they will soon need a major overhaul. I you aren't ready to build an R2 then you certainly aren't ready to care for a geriatric radio.

> What are some receivers to look for (don't say the Collins - I don't
> have enough money)?

What do you want to do? If you are going to operate a lot of SSB, then a Collins mechanical filter is almost a requirement, although some of the more recent DSPs might be better they are a slightly different form of operation so I suspect it is a lot personal. If you intend to operate CW, PSK mostly, then the requirements are different.

If you want to use it as test gear, then you want 1) synthesized, 2) DC to daylight -- almost any modern rice box will fit this bill. If you want to use it on 75 meter phone, then you need brick wall filters or a very good DSP (or both). Most modern rigs are triple conversion, with a first IFin the 60 MHz region, second around 10, and third typically 455 kHz. If the receiver you pick isn't VERY recent, look for a rig with the filters in the 455 kHz IF, rather than the 10, and get the filters if you plan to operate on busy phone bands. Interestingly, CW is a lot less demanding, and the other digital modes even less so. The digital modes do require a lot of stability, but on modern rigs that is pretty much a given.

Because of competition, I think you will find a better deal in a transceiver than a receiver. Decent receivers are kind of a specialty item so they tend to be very expensive. Indeed, it seems like you have very low end stuff and very high end stuff, and not a lot in between. The kind of receiver you can buy new for a few hundred bucks isn't going to be useable on the ham bands. On the other hand, if you only want to know whether your homebrew oscillator is on the right planet, then a cheap, synthesized SWL radio will do the trick.

Used prices are really uneven. Some things you can do real well on (browse through the completed auctions on eBay to get a feel for prices), and others people seem to insist on getting new prices for old gear. If you do go with used, it may be the best thing to do is to pick something and get on eBay. The trouble with eBay is that there are enough people that are clueless that things often sell for well more than they are worth. But on the other hand, if you don't let yourself get sucked in, and you are patient, you can often do pretty well. Just be sure you know what you are willing to pay and don't go beyond that, and that you look forward to spending a month or two getting what you want. But real bargains are pretty rare anymore.

A few years ago I would have suggested a hamfest. But most of the hamfests have gotten a lot like eBay. There will be a wide selection at Dayton, but most will be either real junk or overpriced. I guess that is a difference; you don't see a huge amount of old junk on eBay, probably because of the cost and hassle of listing it. You see plenty at hamfests, though.

The 2B does not have a mechanical filter so no worries there.

I have a Drake R4A (next generation Drake after the 2B) & it is one of the best receivers I have ever owned [I've owned maybe 50+ medium & high end receivers (Collins, Hammarlund, National, Ten-tec, Yaesu, Kenwood, Swan, Elecraft, etc.) in nearly 50 years of hamming including many of the newer solid state variety].

My R4A doesn't drift (after warm up), excellent audio, pass band tuning, 4 stages of selectivity, AM & product detectors, excellent build quality, extremely reliable & much easier to work on than any of the newer solid state stuff. I paid $140 for mine & nice examples can be had for $150 - $250. The R4, R4A & R4B were similar design & were complete radios out of the box. I've had zero trouble with mine in eight years. The R4C went to crystal filters & is really a much different radio.

I would recommend the R4A's & R4B's as great radios that you will not be dissapointed with for the price.

Look for one that is crystalled up with extra SW freq's & has a clean copper chassis (they are proned to tarnish).

Terry

```

I have been playing around with my homebrew VFO, a Hartley oscillator, with a tapped inductor in the tank.

Rough parameters: 6AH6 pentode for the VFO, tank resonant at 1.8Mc, plate circuit resonant at 3.6Mc. Rather low-Q plate tank (on purpose, I want it to cover 100kc or so). Tank tapped about 1/3 of the way from the bottom. 150V from an 0A2 on the screen, bypassed by a 0.005 uF ceramic with short leads at the screen.

While playing around with it I found this weird mode where it wouldn't necessarily start up in constant oscillation. It would repeatedly (30000 times a second) start up (starting up very quickly, in just a few cycles), grid and cathode circuit amplitude would build up to about 10V p-p, then the oscillations would slowly (over the next 30 microseconds) die down. Then it would repeat.

Hand capacitance near the grid or on the tank coil would often break it out of this mode and into more regular oscillation. Putting a 10x scope probe on the grid sometimes broke it out of this mode too.

What eventually made the circuit more reliable was putting a few hundred ohms in series with the grid. But I don't understand exactly how this helped.

My guess for this squegging mode is that the oscillator would suddenly start, the tank would ring, the tank would ring hard enough that grid current flowed, and that the grid current somehow would "latch" on until oscillation died out, then it would repeat.

Or, just maybe, it's more closely related to screen current and maybe some kind of oscillation of the 0A2 in the screen regulator. I tried changing the dropping resistor feeding the 0A2 and a couple different 0A2's but the squegging seemed relatively insensitive to it.

Trying some other pentodes that were not so "hot" (e.g. 6AU6, 6BA6) changed the squegging a little but it was still there.

My not-understood fix, putting a few hundred ohms in series with the grid, is something that I've often seen in real-world circuits. I think this is to provide some degeneration, and always was under the impression that the degeneration was intended to prevent oscillation in the VHF range. It is possible that the circuit was indeed oscillating at a few hundred Mc but my scope (100Mc bandwidth) didn't see it. And I don't know how a 200Mc parasitic might cause 30kc squegging.

Any thoughts?

Tim KA0BTD

(snip)

(my guess)
The grid acts as a rectifier that builds a DC grid bias
voltage from the rectified AC signal, biasing the tube off.
Then the tank dies a natural death. Adding the series
resistor reduced the efficiency of the rectification.

Sounds like you have too much positive feedback, to begin with.

But in a "normal-functioning" oscillator, the DC grid bias doesn't cut things off for so long, right?

The P-P amplitude at the grid (as seen by my 10x scope probe) when the circuit is not squegging is in fact larger than when it is squegging.

I suppose it is possible there's some weird kink in tube characteristics for all the pentodes I tried.

> Adding the series
> resistor reduced the efficiency of the rectification.
>
> Sounds like you have too much positive feedback, to begin with.

Probably, but moving the tap on the tank coil had little effect. The handbook says about a third of the way up from the ground end, but I tried it at a half, two-thirds, one-tenth, etc. It did alter the shape and timing of the squegging a little bit but it was still squegging. If I moved it too far the circuit didn't oscillate at all (too little feedback).

Also, changing the biasing (trying to move it further into class A) by putting a cathode resistor in didn't help much either.

Tim.

Right. If you don't have way too much loop gain, the bias
just shifts enough from the grid leak effect to slightly
lower the loop gain so that a stable oscillation takes
place. The negative feedback loop that adjusts this gain
adjustment effect can be stable or unstable.

My concept may be over simplified, and not include
everything that is happening. I would look at the screen
bias voltage during the squeeging to see if it is also
bouncing with it, or remains stable through a cycle.

> My not-understood fix, putting a few hundred ohms in series with the grid, is something that I've often seen in real-world circuits. I think this is to provide some degeneration, and always was under the impression that the degeneration was intended to prevent oscillation in the VHF range. It is possible that the circuit was indeed oscillating at a few hundred Mc but my scope (100Mc bandwidth) didn't see it. And I don't know how a 200Mc parasitic might cause 30kc squegging.
>
> Any thoughts?
>
> Tim KA0BTD

Spice is your friend. I have found that LT spice is particularly good at predicting squegging, at least in general. There's never a 1:1 correspondence with the real thing, but close is pretty good in RF.

When I have experienced squegging like this it has been because I have built a circuit with a resonance between the circuit capacitances and the RF chokes (you know -- those things you use for biasing that you treat as 'shorts' in your AC analysis?). To the bias circuit, the oscillator looks like a negative resistance, so you get two modes of oscillation at once.

This is complicated by the fact that the circuit wouldn't oscillate at the lower frequency at all if it weren't for the action of the intended oscillation -- it's the current requirements of the active device as oscillation build up that cause the negative resistance action that causes squegging.

I suspect that your grid resistor is killing the Q of the circuit at 30kHz, which kills the squegging without killing the intended mode of oscillation. You may find that loading any bias chokes with carefully selected, unbypassed series resistance will also kill the squegging. You can also sometimes kill it by reducing selected bypass capacitances to lower the circuit Q at the squegging frequency.

Of course all of this also lowers the circuit Q at the desired oscillation frequency -- that's life. Your job is to find a happy medium that gives you good oscillator performance without squegging. Or start building superregenerative receivers!

Wow, man, if I make it happen again I see the screen voltage
motorboating up and down by about 3V (around the nominal 150V) at about
30kc.

Changing the screen bypass capacitor between

680pf/0.001/0.002/0.005/0.010 and changing the current through the 0A2 between 5mA and 10mA and 20mA and 30mA doesn't stop the squegging but it does somewhat alter the timing/amplitude.

Plate can be held at a steadyish 350V (even bypassed) through all this.

So this is something like the textbook squegging which seems to be something like a motorboating of the plate voltage, but in my case I see it in the nominally regulated screen instead. New one for me!

I don't think this is quite like the typical NE-2 relaxation oscillator circuit, because I thought 0A2's were supposed to be stable with these small amounts of capacitance and the behavior seems independent of room lighting, but I could be wrong. The screen voltage waveform sure as hell looks like a relaxation oscillator at 30kc.

Looking at my old schematics I see my Heath HW-16 crystal oscillator puts the crystal between the screen and the grid of a 6CL6. Manual says that the screen is serving as the plate of the oscillator. Probably completely unrelated to the intended operation of my oscillator (where I bypass the screen and the leads are short) but may be related to the unintended mode of operation!

Tim.

What are the three terminals of your oscillator? Your screen is
grounded, so I assume that the grid and cathode are both floating at RF
-- is this so?

I think you are talking yourself out of the problem.

It sounds like you are trying to build an electron-coupled Hartley oscillator. There is no way that a voltage change of 3 volts on the screen (which is functioning as the anode, for Hartley purposes) is going to start and stop the oscillator.

Watch the DC voltage on the grid. You will see it follow the relaxation oscillator waveform when the thing is squegging.

The fundamental problem is two-fold. First, too much feedback. Second, the time constant of the grid circuit is too long. The stored energy in the tank can continue to charge the coupling cap even after the plate current is cut off, and it can't start to oscillate again until the charge on the coupling cap bleeds off.

Start by lowering the grid circuit resistance and lowering the capacitance of the grid coupling capacitor. This will work to cure both evils. Taking a quick look at the 6AH6 curves I would guess that, at 6 MHz, your coupling cap should be about 22pF and the grid return about 10K. The 6AH6 is also a sharp-cutoff pentode, so it will be very sensitive to small grid voltage changes near cut-off.

Don't get distracted by the swings in screen volts, you are just drawing large pulses of current and pulling the supply down. Unless the 0A2 is going out of conduction RC oscillation is unlikely.

What you write, which relates the Q (probably very low hundreds) of the tuned circuit and it's frequency to the period the squegging, is in good agreement with the squegging I observe. Will check the DC grid voltage with the scope tonight.

The grid tuned circuit is at 1.8Mc, and the squegging seemed insensitive to the coupling cap. 100pF is the handbook value, but I did play around with it. Too small (39pF) and no oscillation. At 56pF there was squegging.

Did not try playing with the grid return value (still at 47K from the handbook), that may indeed be the key.

Tim.

> -- is this so?

The circuit is the "tuned plate Hartley" as it appeared in any
50's/60's/70's ARRL handbook.

The grid tuned circuit is at 1.8Mc, the bottom end of the inductor is
grounded, there's a tap nominally one third of the way up to the
cathode, and the top of the inductor is connected via a 100pF capacitor
to the grid, which has a 47K to ground.

The plate circuit in my current incarnation is tuned to the harmonic at
3.6Mc. The "untuned plate" version in the handbook has a RF choke
instead of a plate tuned circuit, and indeed I had this on the bench
for a little while.

Tim.

SC has been bragging for quite some time now about No-Coders - but has "yet" to show where "he" has ever been licensed as a ham at all let alone "with" code. I don't care to give my call here - but have in the past and will again if asked. It doesn't prove a thing one way or another. My call - though I'm an extra - happens to be my old KA Novice Call sign. Been an extra quite a while. Went from Novice - Technician (80s) - Advanced - Extra.

It is amazing you guys keep him in entertainment by acknowledging his ridiculous remarks. GET A LIFE - SC -whether we like it or not - CODE IS GONE. You're beating a horse that has been dead quite a while. You've been on this stupid kick for about 5 months now. Don't you have anything better to do?

> Hand capacitance near the grid or on the tank coil would often break it out of this mode and into more regular oscillation. Putting a 10x scope probe on the grid sometimes broke it out of this mode too.

> Any thoughts?
>
> Tim KA0BTD
>

I normally don't post, but, since I have done my own amount of torturing of the 6AH6, I think i know what the problem is.

The 6AH6 is slightly misnamed.
The 6AH6 isn't really a pentode.
It's just a really small beam power tetrode.
It has usable gain up to the UHF region.
And it suffers a lot of the same personality disorders of it's larger brothers.

It's rated at 3.2 watts plate dissipation.
But I have ran it close up to about 12.5 watts for extended periods.
At that point, the tube starts to show obvious signs that it's close to the breaking point.
The plate starts glow red, but it didn't kill it.
Probably hurt it a good amount, but it didn't kill it.

The more current it pulls, and the lower the input and output impedance, the higher the tendency for it to break into oscillation.
It will oscillate up to the UHF region easily.
It's preferred method of oscillation is the grounded grid form.
The cathode is the input, and the anode is the output.

When you have low resistance feedback loop from the plate to the cathode over six or so inches long, and start pulling a good bit of power, then it can go at any time.

Look up parasitic oscillation in your handbook..
You will see the circuit that is causing it.
Large power tubes top out at 100Mc or so.
But this small one can go up to 400 to 900Mc if it's being driven hard enough.

The loop is most likely from your plate, through the tuning cap of the output tank.
The cap will look like a short circuit at UHF.
It will then go through the chassis.
And then through the cathode tank, which is shorted by the tank cap at UHF.

Ways to solve the problem.
Turn down the plate, and screen voltage.
It will drop beam current.
That will increase the resistance of the tube to the point it can't

parasitically oscillate.

Or you could put a 100 ohm or 1000 ohm resistor in the plate circuit.
In big amplifiers, where you can't tolerate a large resistance in the plate lead,
they use parasitic chokes.
The appear as a short to DC, and the desired operating frequency.
But they appear as a high resistance to the VHF oscillating frequency.
It basically de-Qs the VHF oscillating circuit.

But you can tolerate a little bit of loss in the plate circuit of this unit.
So, just put a 100 ohm resistor in series with the plate.
If that don't work, then try a 1K resistor.
I am pretty sure that it will settle down and behave.
It will be a lot easier that winding a parasitic choke for it.

You also want to take a careful look at the screen circuit.
It can also act like an output in a parasitic oscillation.
So, try putting a 100, or 1K resistor in series with it too.

It's oscillating cycle.
It starts it's HF oscillation gain cycle.
The signal grows, and the tube bias increases.
The current on the positive peaks grown with it.
The current on the positive peaks get to the point that
the tube breaks into UHF oscillation.
The UHF oscillations are several times larger than the intended oscillation.
The UHF oscillation only last a fraction of the high frequency cycle.
When it starts it's UHF oscillation, it quickly charges the grid capacitor
up to a very high level.
Way past cutoff.
The UHF oscillation quickly extinguishes it's self.
But since the tube is in cutoff, the intended HF oscillation dies too.
The grid voltage drops back to normal, and the tube starts the cycle again.

Other ideas
You could also increase the grid leak resistance.
Push it up to 1M or so.
It will decrease the tank loading, and allow it to start easier.
And it won't pull so much positive peak grid current,
and cause the tube to conduct so heavily on the positive peaks.

You can tease out the UHF oscillation into the open if you short the primary grid tank,
so it can't oscillate at it's intended frequency.
Basically, zero signal condition.
Then, push up the plate, and screen voltage.
If you have a little signal strength meter that works up to the UHF range,
with it's antenna clipped to the chassis, or wiring.
You will se it start to come alive.
You will be able to move your hand around the unit,
and it will break into, and out of oscillation.
Sometimes, it will motorboat, or operate continuously.

You want to change the circuit so that you can't get it go parasitic,
even when you really push it to it's limits..

Then un-short the tank and you are ready to go.

Tim,

My guess is the OA2 (Neon) and Cap combination is causing the problem.
Isn't that an oscillator in itself ?

Try replacing the OA2 with a Zener (or 3 in series). It may be a bit
noisy, but it may also be stable.

Or... a pair of resistors to derive 150V from HT. Just to see if squeg.
stability improves/changes. 15k + 18k for a 350V HT (just a guess).

-Mark

OK, I saw the parasitic last night!

I only have a 100MHz scope. Putting a scope probe on the circuit seems to often kill the squegging. But I put a little loop on the end of the scope probe and sniffed around, and indeed there was a 400MHz parasitic that would build up over maybe 0.1usec. Then the impulse from this set the tank ringing at 1.8MHz, and after the ringing mostly decayed (30usec or so) the cycle would repeat.

There seemed to be the most energy at the well-bypassed screen and not at the plate, but remember this is an electron-coupled oscillator so the screen is working as a plate.

I guess even a 0.001uF ceramic cap with short leads isn't a good bypass for 400MHz!

There must've been substantial 400MHz energy to show up on my 100MHz scope :-).

My band-aid of a resistor in series with the grid seems to do the trick.

Tim.

Your resistor in series with the grid would have much more effect on a UHF oscillation than on one at 30kHz, indeed.

Even a 1nF chip cap soldered directly between the screen lead and cathode of the tube would have the internal tube lead inductances to contend with, so you're probably never going to 'get there from here' by that method.

I wonder if a loading resistor in the screen lead instead of the grid would work?

Nice post. A while ago, I went into "hair-pulling mode"
the other way - *trying* to cause squegging in a one
transistor DC-DC booster. Finally got it with a bit
of fiddling. Maybe it belongs under Murphy's section
on oscillators:

When you don't want oscillation, it will oscillate
When you want oscillation, it won't
When you want to get rid of squegging, you can't
When you want squegging, it won't

Do all Parisitics (sic) come from Paris? :-)

Ed

Yes.
My original reply also mentions that.

....
You also want to take a careful look at the screen circuit.
It can also act like an output in a parasitic oscillation.
So, try putting a 100, or 1K resistor in series with it too.
....

He says that the .001uf cap isn't much good at bypassing.
The problem is it's too good at bypassing.
It acts as a short to the UHF parasitic.
That allows enough UHF energy to be conducted to the chassis to allow it to go parasitic.
Shorting the energy to the chassis, isn't the cure to the problem, its the cause of the problem.

So I will clarify my previous statement.

You want a 100, or 1000 ohm resister in series with the screen.
Between the bypass cap, and the screen.
Not between the bypass cap, and the supply.

You want to isolate the capacitance from the screen.
That will break the loop required for oscillation.

> When you want squegging, it won't

I have a hard problem making a amplifier that can put out a solid 1.8Mhz
signal.
But I can build a DC power supply that produces a quality 80Mhz signal.

Maybe, if i want an oscillator, I should try to build a DC supply circuit,
and vice versa.
I will figure it out one of these days.

Since a 220 pf capacitor with �" leads self-resonates somewhere around 150 MHz., you might want to do the old "put a variable capacitor between screen and cathode and tune for minimum squeeg" trick. All you are doing is making a series resonant circuit with the stray inductance of the tube and the variable capacitor to short whatever nasties you don't want out.

Jim

>I think using radio broadcasts as a means to communicate information to a global 'spy' network has become passe. Modern spy and terrorist networks increasingly use a method called 'Steganography' to hide messages and data inside picture files or other media files that are easily posted through the internet.

If you're in a western country, sure... but I imagine there's still plenty of spying going on in eastern Europe, the middle east, Asia, etc. where Internet connections are nowhere near as easy to come by.

Of course there is satellite communication, but that's significantly more costly for everyone involved. Plenty of spying is just going to, e.g., local libraries, government officies, etc. and turning the vast volumes of data that if freely available into useful *information* for your own government... a very ho-hum sort of job that requires little if any technology.

Hi all!

I couldn't find a place that sells this type of variable capacitators, so

I decided to build my own, but I think I could use the feedback of people who actually know what they're doing. Since I know none, I had to settle for r.r.a.h. (Just kidding!! ;D)

I don't have a DX license yet. I'll probably get one last when I decide I want to build a transmitter, but it'll be a good while until I know enough to do that. An ATU seemed a simple enough curcuit to start with, and it seems I'll be building every part of it from scratch. So, too late to cut to the chase, what I'm planning is using

32 aluminum plates
200 x 50 x 2 mm each
cut diagonally in half
to make 64 plates total
40 cm^2 actual surface area each
spaced 3 mm apart.

This should make a cap weighting in at 743 pF with a voltage tolerance of almost 9 kV according to the KI6GD Capacitator Calculator, if I'm using it right. I'm going to build two of them. It should be... enough. :)

http://img413.imageshack.us/my.php?image=pict3833tj4.jpg
http://img138.imageshack.us/my.php?image=pict3834eu7.jpg

First pic is of the plates I'm going to cut, and second is my schematic.

As you can see I'm going for an unusual shape with the plates. This is to minimize my work load. I'll just have to cut straight, drill a hole and file down the corners to prevent corona discharge. Once the caps are complete I'll just measure their values at different levels and make a chart or scale.

So r.r.a.h, if you are still reading, what has this humble newbie already screwed up? I know the sensitivity is going to be extremely high, but I should be able to fix that with some simple mechanics. My old LEGO bricks should do the trick, come to think of it...

Thank you very much for reading. Hope to see a reply, even if it's just "Go for it!" or "You've got it all backwards".

--
Sincerely,
Nosforit

Indeed this is a working fix, as I verified on the bench.

> It's oscillating cycle.
> It starts it's HF oscillation gain cycle.

Actually in my particular case it appears that the UHF parasitic starts first. But probably just the luck of the bias point.

> The signal grows, and the tube bias increases.
> The current on the positive peaks grown with it.
> The current on the positive peaks get to the point that
> the tube breaks into UHF oscillation.
> The UHF oscillations are several times larger than the intended oscillation.

Very true here - this is in fact the only time I've seen 400MHz stuff on my 100MHz scope, so I'm guessing that there is substantial UHF energy there.

> The UHF oscillation only last a fraction of the high frequency cycle.

This part is very true too. Tiny tiny fraction of a microsecond. My interpretation of the scope trace is that the UHF activity gives the

the HF tank a "kick" and it rings for a while.

Tim.

Well, this is basically a "go for it." I'm not quite clear on how you are going to stack up the plates when you're done...what holds them in position and so forth. One advantage of the "normal" semicircular plates is that there's not such a long piece of metal hanging off the rotor shaft as you will have, assuming the shaft runs through the "pointy" end of the rotor pieces. Beware of what vibration does to you, in other words. As thick as your plates are, I suppose that won't be a problem.

The widest-range variable I have is built with circular plates, with a tab off the edge of each through which the rotating shaft goes. There are actually two rotors, which are coupled through equal-size gears on each shaft, so one rotates clockwise as the other rotates counterclockwise. The plates go from full mesh to full separation, and give over 100:1 capacitance ratio from max to min. The shafts must be insulated from each other, of course. There's some advantage to a capacitor with a wide tuning range in an ATU, in getting the ATU to be able to cover a wide range of matching impedances over a wide range of frequencies. Anyway, I suppose you could do something similar with your rectangular plates.

Cheers,

Tom

Hi Folks,

I just found this group. Not sure if this is the right place to ask, but here goes:

I am presently a student studying for my MSc in Applied Physics. Next semester I have a course in Electronics which is going to require me to do a project. Now I have worked with radio control vehicles before (ROV's), but this time, I wanted to build a vehicle and have it be semi autonomous, ie with a microcontroller. Along with that, I will need a fairly long range (say, 1 mile) video transmitter to put "eyes" on the vehicle. I have worked with the short range, commercially available wireless video cameras that use the pinhole camera and have a range of about 300 feet unobstructed. I was wondering if anyone on this forum knows of a kit that I could purchase to build one myself (I may be mistaken, but an assembled unit probably costs a lot more). If this is not the right forum, pls let me know that too. Links, ideas, etc are welcomed.

TIA,

Joe

> problem.
>
> The widest-range variable I have is built with circular plates, with a

> tab off the edge of each through which the rotating shaft goes. There are actually two rotors, which are coupled through equal-size gears on each shaft, so one rotates clockwise as the other rotates counterclockwise. The plates go from full mesh to full separation, and give over 100:1 capacitance ratio from max to min. The shafts must be insulated from each other, of course. There's some advantage to a capacitor with a wide tuning range in an ATU, in getting the ATU to be able to cover a wide range of matching impedances over a wide range of frequencies. Anyway, I suppose you could do something similar with your rectangular plates.
>
> Cheers,
> Tom

Hello Tom. Thank you for your reply. :)

I'll separate the plates with spacer disks and bolts on a 6 mm threaded steel rod, indeed through the pointy ends. 6 mm is IMO too thin on its own, but the disks and bolts should add a lot of stability. The entire thing will be propped up on plexiglass plates at the ends, and I'll have one additional 6 mm threaded steel rod where I marked 60 degrees on my schematic. If it still not stable I'll add something to the top and bottom to keep the rods stretched straight. If that still isn't enough, I'll have to build some sort of support for the mid-section.

The blades will separate from each other more than completely, if I want to. I don't know the electrical implications of what would happen if I did so. I guess at some point the curcuit would simply be broken... Maybe permanently? Either way, infinite ratio from max to min. ;)

I plan on either adding a counter-weight, a rubber band, or some mechanics to keep the rotor from simply falling down. A counter-weight should give a nice 'feel' to the dials, which is very important for any sense of "quality".

If the parts of the ATU turn out reasonably pretty I'll make an enclosure largely out of plexiglass for them. A cardboard box is however a lot more likely. I expect the end result to look horrible and work marginally better. XD

Ten Tec in USA offers a variable capacitor kit, max C is 500pf @ ~5kv.
Cost is about $80 USD. Takes about a hour to assemble. I use them in
a 1.5kw ATU and they work fine. Kit #1207.

If you get all the parts, cut them up, and assemble the whole thing,
homebrew, makes the $80 price tag seem reasonable. I could see you
spending more than half on just materials.

Good Luck,
Gary N4AST

Joe,

Before suggesting anything it would be helpful to know a little bit more about the requirements. Are you considering analog or digital TV transmission? What frame rate is required? How many horizontal lines? B/W or color? Are you planning on using amateur radio or unlicensed frequency bands? How long are the transmissions? Any size/weight constraints?

There are many tradeoffs to be considered. For example if you are sending digital pictures, the frame rate, vertical and horizontal resolution, and color depth will dictate the data rate in bits/second. Based on a given data rate there will now be tradeoffs in terms of frequency band, power, bandwidth, SNR, antenna size, power supply requirements etc.

We also need to know if you are considering building something at the component level or whether you are trying to use off-the-shelf modules.

Sounds like a fun project - Roger

Hello Roger,

Whew! Well, I am glad you asked. I would like to use the KISS principle, if you know what I mean. I will try to answer in the order you asked: Analog TV, actually, I would like to use my own TV, like maybe cable channel 59 (I know we have some video bandwidth around there, 70cm) at least for the initial close to home testing. However, there is a possibility (remember, this is still a work in progress) that I will want to monitor the video from my vehicle in a field type test situation, in which case I have a couple of smaller color monitors that run on 12V and use RCA phone jacks, so I would need a receiver box to plug into the monitor. Definitely color TV and I thought that , given the range requirement of about a mile, I would need to use the amateur band. If not, that's fine too. Length of transmissions, now I hadn't thought about that one. I was planning on sending him on his way, as I said, semi autonomously (with a microcontroller taking care of all the things like not bumping into anything, going off cliffs, or ending up in the drink), and then send a command (possibly DTMF thru walkie talkie) to switch on the video and start monitoring where he (well, it) was located and what he was seeing. The size, weight and power constraints: It is to be an all terrain type vehicle, right now I am planning on using a steel platform (actually, one of those radio flyer wagons) which weighs about 10 lbs unloaded. I would estimate that after adding the motors and wheels (big wheels, like maybe 12-14 inch diameter), 12V deep cycle battery (about another 40 to 60 lbs), I may be able to accomodate another 5 lbs or so for the camera, and transmitter, and possibly another separate power supply (battery) for the camera since I will be using a 6V (4.5AH) battery to power the microcontroller and associated electronics, sensors and whatnot. I would rather have the 12V battery powering the DC motors that will be propelling him forward (they will probably be pulling 3-5 Amps each). So there will also probably be inductive 'noise' from the motors as well, but I believe I can shield most of that, if necessary. I always prefer to use off the shelf items, but I can do some soldering and putting kits together also. I guess to summarize, it is very flexible in this stage, as I haven't gotten the motors or wheels together yet, I am still planning all this and trying to cover all my bases so that I can have something working possibly by the early summer when semester ends. I have done this before, but on a much smaller scale and limited only to ROV's using off the shelf radio control non amateur band. I realize there will have to be tradeoffs, e.g., I may have to go with black and white instead of color, I may not need a mile range for the video transmission,etc. I think TV resolution is 480 lines. That would be ideal. I guess I am wondering what is out there for me to choose from and then tailor make this part of the project based on my budget and what is available. Also, I may not necessarily be line of sight when I will be needing the video (in a field test situation). I really don't know about transmission times.

Oh yes, it's going to be fun..It already is :--]]]

Joe,

Given that you plan to transmit analog television transmission you will want to operate on the ham bands. The unlicensed stuff will not have the 1 mile range given the bandwidth and SNR requirements.

I suggest you get a recent copy of the ARRL Handbook. Chapter 9 has a section on Amateur Television (ATV) and Radio Control. There is an example of ATV mounted on a model Humvee.

There is a lot of good info on the ARRL site at
http://www.arrl.org/tis/info/atv.html

Google is your friend - a search on "amateur television" gave lots of sites with interesting equipment that can be purchased or built. There are groups and forums where you will get lots of practical tips.

Roger

You can get a mile unobstructed with WiFi, and it does tend to be a little less expensive than ATV. However, to get that sort of range does rely on using a channel within the amateur spectrum, and more significantly, requires a lot of antenna gain, unless you move to a lot of power which again gets expensive. Depending on your vehicle, that sort of antenna gain might not be practical. Relatively small WiFi antennas can be astonishingly directional.

You might also consider 900 MHz. This allows more reasonable antennas than 440 and equipment is still somewhat inexpensive, although not as widely available as WiFi. It is a little easier to get the mile on 900 MHz than 2.4 GHz. (been there, ran the tests). On 440 you are likely to encounter QRM (I'm assuming from the 1 call you are in the upper right there where there's a bunch of people) and antennas are going to be larger, something of a problem for your vehicle. ATV receivers for 900 MHz are fairly inexpensive.

I assume you are going to rely on the vehicle for camera positioning, or you are going to build it yourself. If you want to buy pan/tilt/zoom capability, then digital gets dramatically cheaper.

I'm doing a random wire "semi-automatic" tuner, and also trying to make varicaps for it. I found a eBay seller from Germany, if I remember right, who sells ready-made air-varicap plates. I bought few dosens of them for 20 euros. I think the seller ships worldwide. I'm sure there is other producers too...

I would like to know what the actual OD is of schedule 40 PVC tubing.
I am building a NVIS dipole for 3.6 & 7.2 Mhz
I know what the wall thickness is and the nominal size, but say for instance
the OD of 1 1/2" schedule 40, is it really the OD they are measuring?

Here in Australia we have a quaint method of measuring structural steel pipe
where the OD is nothing like the size its listed at.

For example 3/4" pipe is actually 1 1/16 OD!! Give or take the wall
thickness, but its still known as 3/4" pipe!

Thanks
John

That's a rather good deal. I paid 25€ for material costs and an additional 5€ to my neighbour who got them for me. My brother who teaches handicrafts at a school is going to let me use the workshop to do the rest of the work, so right now I'm looking at a cost of 33€ for materials, but I still haven't bought the plexiglass.

How is your tuner going to be semi-automatic, if I may ask?

p.s I can see you're a fellow Finn aswell, so here is a rather useful link I found earlier today:
http://www.tkk.fi/Misc/Electronics/faq/sfnet.harrastus.elektroniikka/

liikkeita.html
I'm sure Vekoy is a familiar place for you already, but still... ;)

Those are not all that awful prices for the rest of their kits... The BFO

circuit looks especially tempting. I'll be sure to check it again when I
decide I'm going to build an actual radio. Thanks for the link!

> How is your tuner going to be semi-automatic, if I may ask?

=========================
Suggest you consider a stepper motor from a dumped
printer/scanner/floppy drive or HD ,if necessary including a shaft
rotational reducer when steps are too big.
Google will provide you with suitable (simple) circuits to drive the
motor ,usually involving one or more opamps.
From semi-automatic the circuit can evolve towards a fully automatic
system with a SWR sensing circuit.

There's a short but interesting story behind that on the link above.

Thank you for the info. I will look into 900MHz and WiFi. I was only
planning on panning, no tilt, and no zoom.

Check for dynatron oscillations; the screen acts as a plate, sort of.
http://en.wikipedia.org/wiki/Dynatron_oscillator

I can't find a schematic of one, but it's just an oscillator with feedback
from the screen to the grid.

How long are the leads of your screen bypass cap, and where are they
soldered down?

Thanks,
Rich

I've been working on a high-power HF autotuner design that I'd just about shelved because of the necessity of soldering the DDS chip. (it uses an internal RF source to power the phase detector)

This thread has helped a lot. When time permits I may order up some parts and give it a try. I have a good-quality magnifier lamp and a fine-point temp-controlled pencil, what I don't have is OEM eye lenses and flexible finger joints... ;-)

> For some reason the instructions that came with the DDS-60 kit have you solder all the ic's on first, then the resistors and caps.
>
> After thinking I had done a good job on the AD9851 I put the board under my binocular microscope for a close in look. I saw what looked like microscopic solder bridges between the chip leads. I was able to remove these with a stiff piece of paper slid between the chip leads. I still see strange 'hair like' structures all over the board under the microscope. I may be seeing dust, bits of flux, who knows! The microscopic world is strange, especially in 3D.

Nonsense. Homebrewing is building things from scratch, period. Crossposters and off-topic posters like yourself are the bane of the newsgroups. If you want to purchase parts for repair, go to rec.radio.swap. It's why different newsgroups exist in the first place.

------------ REPLY FOLLOWS ------------

I'll bet there are even more newsgroup users who are tired of people posting messages that have nothing to do with the topic of the newsgroup.

I'll spell it out for you: The three newsgroups you have posted to have nothing to do with a "moment of silence". There is newsgroup which is a catch-all for amateur radio related items: rec.radio.amateur.misc.

Now that you know, I trust you will post correctly in the future.

Bill, W6WRT

For some reason the instructions that came with the DDS-60 kit have you
solder all the ic's on first, then the resistors and caps.

After thinking I had done a good job on the AD9851 I put the board under
my binocular microscope for a close in look. I saw what looked like
microscopic solder bridges between the chip leads. I was able to remove
these with a stiff piece of paper slid between the chip leads. I still
see strange 'hair like' structures all over the board under the
microscope. I may be seeing dust, bits of flux, who knows! The
microscopic world is strange, especially in 3D.

Another dang canned message...it's getting kind of boring reading the same thing over and over and over...try a new message please.

The Message Template is the enemy of actually saying something important. It is far too easy to bring up the pre-typed message and offer a generic response to everything that gets one's dander up.

Now to add something to make this post "legitimate"...

I'm building (from scratch) a remote frequency readout so other hams will be able to determine which frequency I'm on while mobile, should they actually like to talk. I plan to use only one 7447 for BCD to 7 segment conversion and each digit LED will be wired in parallel and multiplexed. I went this way to save money, but it will have one slightly annoying feature...no lead zero blanking. So...can anyone tell me the proper way to hook up the blanking inputs and outputs on a 7447 (I would use one for each digit to get this lead zero blanking). The data sheet I have isn't real clear about the BI/RBO and the RBI pin. I suspect something like the RBO pin of a lesser significant bit would be connected to the next higher digits RBI pin or something like that?

Oh God, be careful...you're looking to BUY something on a homebrewing
newsgroup. Make sure you have zee papers when W6WRT comes jumping all
over you...

Now that I've got that out of the way...are you looking for the brown
square types with the color coded dots on top that look like one sided
dice? I have some of those things, but I'd have to dig them out and
check the values.

Old issues of Hints and Kinks and also the Radio Cyclopedia have directions
on making your own mica caps, as well as paper/foil capacitors.  If you
are going to homebrew it, why not do it all the way?  It would be appropriate
for the time period.

With a modern DVM, doing cut-and-try work to get the values right will be
much easier than it was eighty years ago, too.

Just plonk him. I have. He's now in my killfile just behind the script
that kills googlegroups postings -- which is where most of the OT posts
he uselessly replies to (e.g., the OP here) come from.

But, now, as additional phules start making useless replies to _his_
useless replies....

bill:w6wrt You also replied to and off post. By First telling everyone to
stop replying.. And now to me on how to post.
You make a bad Internet cop by breaking the LAWS that you chose to protect.
Bill I set the coin back up on edge would you like to try a best two out of

three and see if you can knock it over onto TAILS again???????? You are
being the best example of the Know it all I was talking about. Your not
being helpful . Your being condescending. KINDNESS bill.. Be a big man,
not a small one.   Also as long as I'm on here....ah... how can I say this.
"Breaking all the rules". The Other person the self professed you know what
ever. If you give them another Ear to listen they keep on trying to prove
how right there wrong cause is. Just sit quietly by and let AID'S Take care
of them all. It's a great answer to there cause. Big MOUTH & A BIG you
know what......   = Aid's The perfect answer.   OH YES BILL...
I........LOVE.....ROCK& ROLL.... And BEAUTIFUL WOMEN, AND FAST CAR'S
TOO.....And even FASTER MOTORCYCLE'S. I ...... LOVE .....To......GO
OFFROADING......... And I love my Children and my Grand Baby's TOO.
Come on Copper Boy Give me another Ticket...... Like you are so PERFECT
MR>> BILL......... Answer me this Grasshopper..... Which hand do you wipe
with???????????
Signed By ..... Jim

After you've done it enough under a microscope you learn what is going to happen and you can do a lot of it without even being able to see it, by timing and feel. Like you said in another post, there's also the part where you get used to how disgusting any solder joint looks under sufficient magnification...

You have to hand it to him! He did a good job declaring his views
ragarding ham radio
ande he may be right. Ham radio is shurely on the downslide and we
can't blaim that on the FCC. We have the internet now that welcomes
everybody so it wouldn't hurt us if the FCC gave somebody else the
frequencies. We talk of public service well looking at this newsgroups
work it would be better for the whole world if America got off the
bands because we are not liked anymore and this newsgroup does not do
service to America other than showing who we really are.

No he is being realistic. We have more CB sets out there than ham sets
and they are no different to hams. If there is an emergency then CB ers
would probably do a better job than hams and with less quibling. I
think the writing is on the wall for ham radio since they dont provide
a thing for the country It would be better if home security took over
the frequency as we all now use the net instead. Have you heard anybody
on the radio lately if you get my drify

Personally, I'd do the DDS chip first, before the resistors and capacitors. One of the tricks I use is to clean the IC pins with rubbing Alcohol after soldering and removing shorts.

Then, I apply a hot air gun, SLOWLY bringing the temperature up on the pins of the IC. I try to get to barely melting the solder, but not burning the main board. A slow application allows the IC to heat up gradually.

This tends to remove the hairline solder bridges and clean up between the pins of the IC. Since the main DDS chip is the only part on the board, I don't have to worry about heating up and blowing the resistors and capacitors clean off the board !!!

I can, and have, used this same method on a completely assembled board, but I have to pay close attention to the small parts, the tend to want to blow away. In that case, I build a heat shield with tin foil and I press it down on the board all around the IC I want to solder flow and that usually keeps the other parts on the board where I want them.

This all takes a delicate touch, it's pretty easy to get things too hot, but it does provide nice and clean solder joints.

Hi Fred,

Unless you are interested in making precision lab-grade measurements, I think you'll do fine with much less expensive and more available cal standards. Personally, I'd get a set of adapters from your APC-7s to SMAs -- and out to only 500MHz, even BNCs should be OK. If you want to get a bit fancier, adapt the APC-7s to 3.5mm connectors, which mate with SMAs but are higher precision. I personally don't think it's worth worrying about. It's a really good idea to always leave adapters connected to the APC-7s to protect them anyway, assuming you use the instrument often enough that you don't want to leave them covered most of the time. But never leave them uncovered! They are far to easy to damage if left unmated/uncovered.

My experience designing a 3-way splitter that needed to work well to 6GHz is that inexpensive 0805 SMT resistors in the 25 to 100 ohm range work quite well to several GHz, if you're careful about the environment around them (e.g., the size and shape of the holes bored in the grounded block that holds the connectors). I expect that if you keep lead length to essentially zero, you can turn an SMB thru-hole jack into a 50 ohm load that will have at least 40dB return loss out to 500MHz: cut the center pin to the height of the resistors, and solder two 100 ohm 0.1% 0805's radially symmetrically out from the center pin to the outer shell. If possible, get someone with a known-good cal standard set to compare it with that set. An open and a short can be created in the same way. I suppose that one of the free 2-d fields solver applications could tell you if you need to make any adjustment for length, but in any event, just using the same jacks for all three should yield lengths within a degree out to 500MHz. Maybe if I get some time to play next week, I can make some measurements of hacked "standards" against my known-good ones. I'm pretty sure I still have some of the 0.1% 50 ohm parts around.

Cheers,
Tom

Could a spy modify an AM radio by adding a few capacitors?

TIA
Clark KC7FGB

Messages to Spies Are Coded but Not Hidden
Over Shortwave, Anyone Can Listen

By James Gordon Meek
New York Daily News
Friday, December 29, 2006; Page A25

It turns out that anybody can tune in to the world's top spy agencies talking to operatives. All you need is a cheap shortwave-radio receiver, the kind available at any drugstore.

Tune it to 6855 or 8010 kHz.

On the hour, you might hear a girlish voice repeating strings of numbers monotonously in Spanish. "Nueve, uno, nueve, tres, cinco-cinco, cuatro, cinco, tres, dos . . .," went one seemingly harmless message heard last month on a Grundig radio.

It was the Cuban Intelligence Directorate or Russian FSB broadcasting coded instructions from Havana to spies inside the United States.

Turn the dial up to 11545 kHz, and you might hear a few notes of an obscure English folk song, "Lincolnshire Poacher," followed by a voice repeating strings of numbers. That's believed to be British Secret Intelligence Service, MI6, broadcasting from Cyprus.

On 6840 kHz, you may hear a voice reading groups of letters. That's a station nicknamed "E10," thought to be Israel's Mossad intelligence.

Chris Smolinski runs SpyNumbers.com and the "Spooks" e-mail list, where "number stations" hobbyists log hundreds of shortwave messages transmitted every month. "It's like a puzzle. They're mystery stations," explained Smolinski, who has tracked the spy broadcasts for 30 years.

While hobbyists guess at the meaning of each cryptic message or which spy service sent it, it's no mystery to intelligence officials, who confirmed the purpose is espionage.

The signals are too strong to be made by amateurs and are often on licensed frequencies. The State Department once complained to the Israeli Embassy in Washington that "E10" was blocking a U.S. broadcast, a source said.

"I can't imagine who else would waste the time in front of a microphone reading numbers" but a spy, said James Bamford, who has written about intelligence. Bamford calls number stations "simple but effective" spycraft.

"It's extremely effective," agreed a senior intelligence official. "If you have a one-time pad, the code can't be broken, and you can send out dummy broadcasts as much as you want to confuse your enemy."

A "one-time pad" is the key to unlocking coded shortwave messages that the CIA calls "one-way voice link."

It is low-risk because it's known only to the sender and the recipient and used just once before being destroyed, said retired CIA officer Tony Mendez.

Mendez said he would often imprint the code on microfilm or even a cigarette paper. Once inside the target country, a CIA operative could make a shortwave receiver out of simple materials. "The voices are not real people," he added. "They're computer-generated."

A CIA spokeswoman declined to comment.

One-time pads and coded radio began in World War I, said Thomas Boghardt, a historian at the International Spy Museum. Little has changed since, judging by recent espionage cases involving shortwave radios, including that of a man detained in Canada last month and accused of being a Russian spy.

In Miami last week, Carlos and Elsa Alvarez pleaded guilty to lesser charges after the United States accused them of spying for Cuba. A prosecutor alleged in a court hearing this summer that they received shortwave "messages in five-digit groupings." An FBI interview transcript shows Alvarez admitted going into his bathroom "on Fridays to listen at 11" for messages aimed at the couple, code-named "David" and "Deborah."

Wrong, Markie, as usual. But you are just a beginner training wheel no
code tech.

>
> I knew it was hopeless to bread board something with this chip, but even with a PC board soldering something with such close lead spacing is a challenge (especially when you're past 50 with failing close in vision and less than rock solid stable hands). Still I figured I'd give it a try. Armed with the smallest soldering tip available for my Weller PES51 soldering station, a good magnifier lamp AND a binocular microscope I gave it a try to solder the chip to the board.
>
> Well there is good news and bad news. The bad news is that it is impossible to solder the chip by hand without creating solder bridges. The good news is that I did a good enough job to get the chip 99% perfectly centered on the solder pads, and you can remove the solder bridges with solder wick without removing the chip from the PC board.
>
> It would have been easier with thiner solder (I had .021" dia solder) and a thiner soldering iron tip, but inspection with the microscope shows no shorts, and it looks like all the pins are properly soldered. Naked eye it doesn't look pretty but it should work.
>
> Now to solder those chip caps and resistors! (They should be easier, the AD9851 was the worst part to place with the tight spacing, all the other parts have lead spacing at least twice as wide).

Be sure to more or less "drown" the pins to be soldered with flux. If you get solder bridges, you probably have to little flux applied - really slob the flux on the pins. When you think you have enough of flux, add more...

Any bridges are corrected with solder wick.

The AD98xx can be soldered with a 0.5mm ceramic tip. Get one of these cheap (10$) magnifying visors, especially if you are half blind as I am...

The AD9851 is one of the easiest SMD IC's to solder as there are pins only on two sides.

Besides... We have been using SMD's since the early eighties now so stop whinging over it, adapt! They wont go away and they actually improve most RF designs!

> Could a spy modify an AM radio by adding a few capacitors?

Not well, but where can you buy an AM radio or capacitors anymore :-) ?
Or was this some hypothetical 1940's time-travel question?

A $10 super-el-cheapo pocket SW receiver from a discount store does just fine for picking up numbers stations. Some but not all number stations are CW or SSB and you'd need a BFO which is one step up from the super-el-cheapos.

Tim.

In article <U4KdnUv85tC57AjYnZ2dnUVZ_uiknZ2d@comcast.com>,
Clark Magnuson <c.magnuson@comcast.net> wrote:

>Could a spy modify an AM radio by adding a few capacitors?

Possibly, but I doubt that it would work well if you started from a standard US-type AM broadcast-band receiver. The frequencies that this article speaks of are up in the HF band, roughly 10 times higher than the AM broadcast-band frequencies, and these radios' built-in loopstick antennas are not well suited to receive these sorts of signals.

A spy in most Western countries could simply buy an off-the-shelf AM/FM/shortwave receiver (very widely available).

Simple but very effective direct-conversion or superheterodyne receivers (capable of receiving CW, SSB, and AM) can be built out of "junk box" parts by anyone with a modest amount of training and experience. Many of the popular QRP receiver designs could be tweaked to receive on these sorts of frequencies with very little difficulty.

Now, if somebody had an old "7-transistor" AM radio (circa 1960 or so), it would likely be possible to salvage enough parts from it to build a simple direct-conversion shortwave receiver.

I doubt that this would be possible (or at least not easy) for today's highly-integrated IC-based radios.

I've seen some suggestions go around that are very similar to hot-air
rework. I just wanted to mention that SparkFun electronics sells some
rework stations cheaply, and has useful tutorials on soldering SMD
parts. Their site: http://www.sparkfun.com

Or the spy could just login to any of the dozens of SW receivers on the web and tune to his/her favorite spy frequency.

But that's not romantic at all!

Could you clarify this? You mean there are Web sites where
you type in an arbitrary frequency and hear what's being
broadcast on it?

When you have a proper pc board smt is easy (once you've mastered the new soldering techniques. I had no problem getting the AD9851 onto the board. I think the microscopic hairs I'm seeing are a result of using the solder braid wick. I may have not heated it enough and pulled it off too soon leaving solder hairs behind. Flux sure does help, and I'll use plenty when I solder the next few smt ic's down.

I have some smt mounting boards that allow mixing smt parts with through hole on 100 mil grid proto boards. I fear that the extra long leads this adds to the smt parts will make rf performance a problem, especially with 100-400mhz clock signals to the dds chips (AD9951). I've heard of people designing their own pc boards using laser printer output and iron on toner for resit. I've tried this before but with 'bleeding' of the toner during application I don't think I can get better than 50 mil trace separation. Also I've had bad luck etching boards with very thin traces, the traces get etched away before larger areas of copper are finished etching. If I try designing boards for SMT parts I'll probably have to farm them out to a professional house, but this can be expensive for making but one board. (Unless you plan on writing a QST article and selling the extra boards....).

Well, some numbers stations actually transmit modulated morse, so you
wouldn't need a BFO.

Print your design on some kind of clay coated paper (people have used everything from magazine pages to photo paper intended for inkjets) and look at the print with a loupe. Cheap laser printers will produce a result full of pinholes. A nice Xerox will make a good, solid black. I haven't had any trouble with toner melting or running. In fact, once you transfer it onto the PCB it's hard to get off!

> If I try designing boards for SMT parts I'll probably have to farm them out to a professional house, but this can be expensive for making but one board. (Unless you plan on writing a QST article and selling the extra boards....).

You've got to pick the right board house for each order. Some, like batchpcb.com, are particularly cheap if you want few, small boards. They don't have setup fees or even per-board fees, only a per-order charge. But their $2.50/in^2 grows faster than some other places which have bigger minimum size boards/minimum orders.

I have been using an off-shore fab for years and they seem to do just what i want, but have setup fees that make protos expensive. So I went and looked at batchpcb.com but they do mention a $US10 setup fee in their FAQ.

http://www.batchpcb.com/faq.php?osCsid=87afcc3754a0ea1bc1a389ad75decda8

Do they actually charge it?

My problem with the iron on transfers wasn't being able to print thin, close spaced lines on to the transfer medium. The problem was that when ironed on the toner lines 'spread out' so adjacent lines touched. Also a problem was timing just how long to leave the board in the soup to etch. I did heat the etchant up first and used an IR lamp to try and keep it warm, but even so the thin close spaced traces were close to being over etched long before larger and wider spaced traces were 'done'. (maybe a problem with 'Radio Shack' etchant?)

There's a $10 fee per order.  But it's not per board or even per design.
It's more like a "shipping and handling" fee.  So if you keep some boards
on file with them you can always throw in a few (smt adapters, or proto
boards) with another order for only the sq in cost.

>

First, a "spy" is not going to need to build a radio. They will be
able to get their hands on something locally, or (as in WWII), they'll
be parachuted in with the needed equipment. And in this day and age,
with so many means of communication (and at least for the moment, no
all-encompassing wars), there are all kinds of mainstream means of
contacting spies without being tracked. Traditionally, spies were not
radio experts, unless their job was to accumulate information on
radio matters.

But, if someone really did need to assemble a shortwave radio, I suspect it's far easier today than in the past. At the very least, no more difficult than in the past.

Thirty years ago, magazines were full of simple superhets based on standard AM radios. Some would rework the front end circuitry to tune a shortwave band, and the fact that ICs are used rather than transistors isn't likely to make that really difficult. I can remember in 1971 when RCA introduced the CA3088 AM radio IC, and QST ran an article pointing out how it could be used. Obviously not the best choice, but an IC instead of transistors isn't likely to make a worse receiver. The limitations would come from image rejection and lousy selectivity (and maybe lack of IF gain), and those were all there with transistor based radios.

Others would strip off the front end tuned circuits, and simply use the AM broadcast receiver as a 455KHz IF, building a mixer and oscillator to feed into it.

And of course, many would add a converter to an existing AM broadcast radio. Sacrifice one radio to build a converter for another. Then you get double conversion, which would be a good thing given the common 455KHz IF for most AM broadcast radios. For best results, use a car radio for the radio, since they often have better selectivity and of course are well shielded compared to portable AM radios with their loopstick antennas. Need a BFO? Those can be tossed together easily with a transistor off some scrap board, and an IF transformer from a scrap radio (and I seem to recall some using ceramic filters as the frequency determining element in a BFO, and if those work, they are easily available out of scrap radios, compared to ceramic resonators).

ICs may offer better performance. Since transistors in an IC are cheap, they may be more likely to use a balanced mixer. Grab an IC out of a radio, and you've got your mixer (and you have a choice of the mixer from the AM or the mixer from the FM section). Some have put together SSB receivers out of narrow-band FM receiver ICs (they simply ignore the FM detector), and someone used merely the mixer out of a more complicated receiver IC for a direct conversion receiver. A lot of FM broadcast radios use IF strip ICs that don't allow for separate use of the IF amplifiers from the limiters, but I've stripped at least one car radio that offered up an MC1350 IF amplifier. For that matter, use the FM IF strip as a quasi-synchronous detector for AM, or if it's of the right design, feed a BFO into the limiter input and you've got your product detector.

Find a CB set, and you get better IF selectivity, and many will be double conversion. Retune the front end, and replace the synthesizer with a tuneable oscillator. Get really lucky, and the garage sale will offer up an SSB CB set, for even narrower selectivity and of course CW/SSB reception with no mods.

Circa 1942, you'd have far more trouble getting parts. Oh, I

suppose there were more local electronic stores, but there was
hardly any consumer electronic equipment. Nowadays it's really really
common. And that supplies so many useful parts.

Using a standard IF is a bad idea if you are a spy, since the local oscillator is going to be at a standard offset of known number stations.

According to the "Spycatcher" book, MI5 used local oscillator leakage to track down spies already in the 1950's. Thus, if standard IF is used, at least shield the oscillator very well and use some RF stages to isolate the antenna from the local oscillator.

The police in some countries use the local oscillator radiation to detect illegal speed trap radar detectors.

This is the 21st century!

All one needs to do is post a seemingly ordinary message (like this one) in any newsgroup (like one dealing with Disney movies). Use the public library and a pre-arranged name. Bingo! The message appears near instantly all over the world, and in convenient, printer-friendly format.;-)

Even easier on the receiving end. Come on guys!

Chuck

```

I think using radio broadcasts as a means to communicate information to a global 'spy' network has become passe. Modern spy and terrorist networks increasingly use a method called 'Steganography' to hide messages and data inside picture files or other media files that are easily posted through the internet.
Lot's of free software to do this can be found on the net. Here's a link to a tutorial:

http://elonka.com/stego/StegoLR.htm

Do you plan to abolish every activity that does not "provide a thing
for the country"? Simply ridiculous! Sounds like Stalin's Russia to me.

As an American your view of amateur radio is, typically, all about
kicking up the dust in your own backyard. American is merely a part
of the world of amateur radio.

Instead of spamming across the various radio newsgroups why don't

you go and bother your congressman with your ill-conceived ideas and
leave the rest of us to enjoy our hobby.

And, some speeders turn the tables, by monitoring for the LO radiation
from police-band radios... assuming that where there's Smokey, there's
radar-fire.

Not sure whether this is what you're looking for but I found two sites
that seem to contain most of the tube data that was in the ARRL Handbook:

http://www.nj7p.org/Tube4.php
http://tdsl.duncanamps.com/tubesearch.php

Bill, I respectfully disagree. Your strategy works with normal people. Robesin isn't normal, and he'll only go away when his ISP is shut off. He's the originator of the infamous "MARS >>>IS<<< Amareur Radio" declaration and the excrement eating thread. At the moment, he's got himself wrapped up in the flag, so he's untouchable even if off-topic.

Bill...Welcome to the "logic" of Brian P Burke, N0IMD, hiding behind one of his "anonymous" screen names as "hot--ham-and-cheese"

Brian has participated, along with Leonard H Anderson (unlicensed) and Mark Morgan (KB9RQZ) in an anti-Amateur Radio tirades and has fallen flat on his face in one prognostication about Amateur Radio after another. He doesn't like it that I've been right.

One of Brain's favorite tactics is to take comments out-of-context and then try to represent them as the entire "gist" of the comments.

My "MARS >>>IS<<< AMATEUR RADIO" comment refered to the fact that the MARS program was staffed almost entirely by Amateur Radio licensees and was in the very spirit of what it means to be an Amateur Radio licensee...He doesn't want to repeat THAT part since it wouldn't serve his purposes. (to try and embarrass me)

He also claims that I am repsonsible for the "excrement eating" thread. That's a blatant lie. His "friend", Mark Morgan, KB9RQZ, is SOLELY RESPONSIBLE for the authorship of those subject lines and use of profanity. You won't see my subject lines repeating it..

Brain, of course, has NEVER owned up to any one of his own misrepresentatiuons of Amateur Radio. He has made ludicrous claims that have failed to meet any statndard of proof or substance, including any one of several claims of having been a DX station, misrepresentations about MARS, RACES, ARES, and other poorly conceptualized opinions that have fallen by the wayside as failing the test of evidence.

Everyone's entitled to their opinions. Brain's opinions of me are obviously low as he, despite having allegedly been a veteran himself, are anti-veteran and anti-volunteer. I've rubbed his nose in one failed opinion after another.

So...There's my $0.02. Do with it as you will, but I'd take a BIG grain of salt with any traffic coming from "hot-ham-and-cheese", as you are welcome to do with mine.

73

Highland Ham wrote:

> Being in series means they would all be used with the same filament current which can be easily implemented with a circuit employing a 78xx device in constant current mode (obviously in a DC environment)
>
> Frank   KN6WH / GM0CSZ

Andy adds:

That's true as long as the current requirements were the same. For instance, putting a 12V/1amp filament in series with a 12 V/200ma filament will not do well on 24 volts....   Just like putting a 100 watt and a 7 watt light bulb in series across 220 volts....., (guess which one will be the brightest, and for how long :>)))) ??   )

The currents were matched in the 5 tube AC/DC radios, but generally you have to check the filament current rating as well as the filament voltage rating in order to do this...... It ain't rocket surgery, but you can't put tube filaments in series indiscriminately.

Cool, I'll have to look into it.

>

You're right, the voltages range anywhere from 3 to 33 volts. Two of
them are 6V6 tubes, so I have some hope there. Most of them are
miniatures, and some of them have the numbers missing, which makes
things really interesting.

Thanks, but I have two problems - I'm stuck using dialup, and most of
these books seem over my head. Interesting, nonetheless.

Well, these should definitely help me identify which tubes are the most
useful, especially the first link. It's a start. I could use some
schematics, though.

Unless you pay by the hour, it's doable with dialup. Do it late at
night so there's no disturbances, and hopefully less traffic. Be
selective, figuring out what you might find useful before downloading.

I have dialup, and I grabbed some of those books last year, using
this same method. It took time, but if you plan it right, it doesn't

get in the way. Just don't plan to be able to do much else at the same time as the download.

Unfortunately, while I did record the times it took to download those books I did download, I have no idea where I put that list.

Of those books, the 15th edition of THe Radio Handbook is likely the best choice, since it's the most recent of the handbooks they have there. Most of the books are more text books, and the 1941 ARRL Handbook is likely going to use older tubes than you have, same with the 1940 Radio Handbook.

6V6 was the quintessential beam power audio output tube of the 1940s through the 1960s. You can generally "read" the missing numbers if there is anything left of the imprint by gently rubbing the tube on your hair. THe oil from your hair will stick to what is left of the printing and make it readable for a short time. You might take a permanent marker if and when you finally read the number and mark the tube.

As has been alluded to in several posts, you are not limited to the exact tube that the original project had in it. For example, the 6U8 was the VHF/UHF RF oscillator/mixer of choice in thousands of designs. However, a 6J6 oscillator with a 6BE6 mixer will work every bit as good if you aren't fussy about VHF reception. There are dozens of tricks you can play with mix & match tube lineups, some better than others.

Jim

do you want the flat mica caps that are "bare" or the ones covered with dark brown plastic with the little dots on them?

Another thing that has worked for me is to put the tube in the freezer for a few hours. Frost forms in a different pattern around where the number was than on the rest of the envelope. Sometimes.

Thanks, I'll give it a go. I work from 4 pm to midnight weekdays, so I think I'll try this again tonight after work.

TJ Linday says as much in the Impoverished Radio Experimenter. Thing
is, he was scant on details. I wrote them about my project, and I'm
hoping they'll have some ideas.

And after you take it out of the cooler, "huff" on it once or twice (just as people "huff" on their eyeglasses before wiping them with a cloth) and the moisture from your breath may outline the tube identification.

Bill, this is the first Robesin reply in years where he did not forge
the attributes to read "snot-scam-and sleaze..." Robesin is trying to
win you over by playing nice this time. Unfortunately, the rest of us
know his game.

>   Brian has participated, along with Leonard H Anderson (unlicensed)

> fallen flat on his face in one prognostication about Amateur Radio
> after another. He doesn't like it that I've been right.

Robesin is right? When???

Robesin attacks when I reposted an article taken directly from the ARRL
web site quoting an ARRL Vice President >in its entirety< stating that
amateurs have an overblown sense of self-importance.

> One of Brain's favorite tactics is to take comments out-of-context and then try to represent them as the entire "gist" of the comments.

One of Robesin's favorite tactics is to make homosexual inuendo or claims of pedophilia when he encounters someone who disagrees with him.

> My "MARS >>>IS<<< AMATEUR RADIO" comment refered to the fact that the MARS program was staffed almost entirely by Amateur Radio licensees and was in the very spirit of what it means to be an Amateur Radio licensee...

I pointed out that MARS absolutely has non-amateur leadership, non-amateur participants, and an entirely non-amateur mission. Hell, Robesin claims to have been chopped to an NMC MARS slot on Okinawa - as an active duty, non-amateur participant. Yet he continues with his "Sorry Hans, MARS >>>IS<<< Amateur Radio" nonsense. Didn't even know what the MOD was. He tried pulling this stunt before he realized that I had MARS experience.

> He doesn't want to repeat THAT part since it wouldn't serve his purposes. (to try and embarrass me)

Except that I was an actual MARS affiliate and knew what I was talking about. You didn't. Still don't.

> He also claims that I am repsonsible for the "excrement eating" thread. That's a blatant lie. His "friend", Mark Morgan, KB9RQZ, is SOLELY RESPONSIBLE for the authorship of those subject lines and use of profanity. You won't see my subject lines repeating it..

Sorry Robesin, but you are the one who posted the "excrement eating" filth, and keep reposting your quote. Unbelievable, but Google provides.

> Brain, of course, has NEVER owned up to any one of his own misrepresentatiuons of Amateur Radio.

I have opinions but Robesin doesn't allow dissenting opinions. Opinions that differ from his are "LIES."

> He has made ludicrous claims that have failed to meet any statndard of proof or substance, including any one of several claims of having been a DX station,

David Heil/K8MN has me confirmed at least twice. Robesin knows this, therefore Robesin lies.

> misrepresentations about MARS, RACES, ARES, and other poorly conceptualized opinions that have fallen by the wayside as failing the test of evidence.

After it was obvious from one regular on RRAP that his ARES group was unable to fully support an upcoming American Red Cross exercise, Robesin was asked to write a duty schedule for the exercise. The stated requirements were three 3 operators on duty per shift. He shorted the 1st eight hours of the exercise by all three personnel. He claims it was covered, but the supported agency was not supported at all. The subsequent shifts were shorted from one to two operators per shift. Robesin claims that ARES can support all agency needs even when they lack enough volunteers. Amateur Operators can perform Super-Human feats, OR the ARC is just an 8AM - 5PM agency.

>   Everyone's entitled to their opinions.

Not true. Hot-ham is not entitled to an opinion, if Robesin has anything to say about it.

> Brain's opinions of me are
> obviously low as he, despite having allegedly been a veteran himself,
> are anti-veteran and anti-volunteer.

My opinions of Robesin are spot on.

In addition to slinging accusations of homosexual and pedophilia at those who disagree with him, I am now a veteran-hater and a volunteer-hater. Nevermind that I am a veteran and a volunteer.

Robesin has claimed that he can have me picked up on his say so as an LPN with a simple phone call from Tennessee. To another poster on RRAP, he claimed that "People who shoot off their mouths can have their tires slashed, rocks thrown through windows, and wives terrorized," but later clarified that all those bad things would be at someone else's hands.

A well known Amateur Radio store advertising in QST, whose ham daughter was featured in the ad photo, was said to be "selling something" but not amateur equipment.

Robesin, whose father was a Sailor Army Recruiter (I swear thats not a typo), lays claim to seven hostile actions in the USMC, but who's only overseas assignment was Okinawa.

There's more, much more, but if I went on and on and on you'd probably think I was making it up. I'm not. Google provides.

> I've rubbed his nose in one
> failed opinion after another.

Yet it is your excrement on another man's genitals, according to your own original claims and subsequent quotes. Google provides, and you've requoted yourself numerous times.

>   So...There's my $0.02. Do with it as you will, but I'd take a BIG
> grain of salt with any traffic coming from "hot-ham-and-cheese", as you
> are welcome to do with mine.

```
>
> 73
>
> Steve, K4YZ

Your $0.02 isn't worth two cents.  Google provides.

Of course let us not leave Mark out of the insanity. Mark will continue to
crap upon as many posts as he can, whether he is asked to join or not.

Mark is far from "normal", too. Billy Smith already knows that....

How complex of a receiver are you looking to build?

There are a PILE of simple tube circuits on
http://www.intio.or.jp/jf10zl/index.html .

Most of them use Japanese tubes (the site is in Japan, after all<g>) but
I would suggest in many cases you can figure out what U.S. tubes are
similar.

>

William,
He's probably looking for the "bare" ones from that era. They look like a flat block of phenolic with contacts riveted to each end.

Playthings of Past has boxes of them, used. (I drooled over many of the chassis that they came from). There may even be some NOS ones available. Many of those caps were punch stamped with the value on the metal ends, sadly many were stamped in ink on the phenolic that faded completely over the years. You might try contacting Gary Schneider (PTOP) to get the sizes you need. Check the website first to see if they are listed.
www.oldradioparts.com.

This is not to be confused with Mark Oppats site, www.oldradioparts.net. Both are very valuable resources for vintage radio parts. Gary has always leaned toward battery set parts, power transformers, and other hard to find OEM items. Mark is, of course, The King of Kontrols,... and capacitors, ...and dials, and... Bookmark both links and you'll have many of your radio parts needs right there at hand.

Best of luck on your project.

Not true, Brain...Not true. However you go right on ahead with
your tale of woe.

> Robesin is trying to
> win you over by playing nice this time. Unfortunately, the rest of us
> know his game.

Robeson DOES "play nice"...Unless you blatantly lie to me or get
caught lying about something that you should know better than to lie
about.

For example: Brian P Burke promising to keep certain information
"private" via e-mail, but then running right on back to the NG and
divulging that which he promised to not divulge.

Hence the complete lack of respect for Brian P Burke.

>

> Robesin is right? When???

Let's start off with YOUR assertions that ARES.RACES, etc couldn't
/ wouldn't respond to any major disaster in any meaningful numbrs or
for a sustained period.

I said you were wrong.

You said several nasty things about "uniforms", "patriotic
bunting", "ARRL sockpuppet", etc [words, by the way, straight out of
the Leonard H Anderson playbook].

Then came a series of hurricaines and tornaos to the south and
southwest. All of them supported at length by ARES and RACES (among
others, of course)

Then came September 11th...Then came Hurricane Katrina...Then came

Hurricaine Rita...Again, all agencies YOU claimed couldn't / wouldn't respond did exactly that.

We can then dig up your "unlicensed devices" rants, among others.

> Robesin attacks when I reposted an article taken directly from the ARRL
> web site quoting an ARRL Vice President >in its entirety< stating that
> amateurs have an overblown sense of self-importance.

And it wasn't true then, it's not true now.

The ARRL vice president's sentiments are NOT shared by the Department of Homeleand Security, the Department of Defense, Salvation Army, The American Red Cross, the Department of State and other agencies.

> >   One of Brain's favorite tactics is to take comments out-of-context

>
> One of Robesin's favorite tactics is to make homosexual inuendo or
> claims of pedophilia when he encounters someone who disagrees with him.

Only true when there is such evidence of that sort of behaviour, Brain.

So far it's hit the mark (pradon the pun) with Mark and Toiddie. The jury's out on you, but you cleaned up your act.

> >   My "MARS >>>IS<<< AMATEUR RADIO" comment refered to the fact that
> > the MARS program was staffed almost entirely by Amateur Radio licensees

Uhn huh.

And over 95% of Amateur Radio >>>IS<<< staffed by licensed Amateur Radio operators.

> Hell,
> Robesin claims to have been chopped to an NMC MARS slot on Okinawa - as
> an active duty, non-amateur participant. Yet he continues with his
> "Sorry Hans, MARS >>>IS<<< Amateur Radio" nonsense. Didn't even know
> what the MOD was. He tried pulling this stunt before he realized that
> I had MARS experience.

Yes, Brain, I know what the MOD is. You've allowed yourself to be hypontized by Lennie's incessant repeating of that claim.

It was wrong then. It's wrong now.

> > He doesn't want to repeat THAT part since it wouldn't serve
> > his purposes. (to try and embarrass me)
>
> Except that I was an actual MARS affiliate and knew what I was talking
> about. You didn't. Still don't.

Brian P Burke uttering yet again more mistruthful statements in a public forum.

> >   He also claims that I am repsonsible for the "excrement eating"
> > thread. That's a blatant lie. His "friend", Mark Morgan, KB9RQZ, is
> > SOLELY RESPONSIBLE for the authorship of those subject lines and use of
> > profanity. You won't see my subject lines repeating it..
>
> Sorry Robesin, but you are the one who posted the "excrement eating"
> filth, and keep reposting your quote. Unbelievable, but Google
> provides.

Sorry, brain, but one again YOU are lying.

The "excrement eating" posts belong to your "buddy", KB9RQZ. And the recent onslaught of re-tasked subject lines with exactly those words are HIS doings...Not mine.

Stop lying, Mr Burke.

> >   Brain, of course, has NEVER owned up to any one of his own
> > misrepresentatiuons of Amateur Radio.
>
> I have opinions but Robesin doesn't allow dissenting opinions.
> Opinions that differ from his are "LIES."

Again with the deceit.

> > He has made ludicrous claims

> > any one of several claims of having been a DX station,
>
> David Heil/K8MN has me confirmed at least twice. Robesin knows this,
> therefore Robesin lies.

No I don't know this.

I don't have Dave's logs.

However we are STILL awating some evidence of the validity of your claims of having operated legally from Somalia.

> > misrepresentations about MARS, RACES, ARES, and other poorly
> > conceptualized opinions that have fallen by the wayside as failing the
> > test of evidence.
>
> After it was obvious from one regular on RRAP that his ARES group was

> unable to fully support an upcoming American Red Cross exercise, Robesin was asked to write a duty schedule for the exercise. The stated requirements were three 3 operators on duty per shift. He shorted the 1st eight hours of the exercise by all three personnel. He claims it was covered, but the supported agency was not supported at all. The subsequent shifts were shorted from one to two operators per shift. Robesin claims that ARES can support all agency needs even when they lack enough volunteers. Amateur Operators can perform Super-Human feats, OR the ARC is just an 8AM - 5PM agency.

Sigh.

I guess we can only watch Brain continue to make a fool out of himself.

> > Everyone's entitled to their opinions.
>
> Not true. Hot-ham is not entitled to an opinion, if Robesin has anything to say about it.

Sure. Have an opinion.

But when you express it as "fact" and the "facts" don't bear up under the scrutiny of 3rd party reports to the contrary, don't get upset when you get "called" for your errors, Brain.

> > Brain's opinions of me are obviously low as he, despite having allegedly been a veteran himself, are anti-veteran and anti-volunteer.
>
> My opinions of Robesin are spot on.

Uhhhhhh...YOUR spots are usually little yellow rings on the carpet, Brain.

> In addition to slinging accusations of homosexual and pedophilia at those who disagree with him, I am now a veteran-hater and a volunteer-hater. Nevermind that I am a veteran and a volunteer.

You hated them before, Brain...I am sure I am only the focus of your disdain in THIS forum.

You've not had a single constructive, complimentary thing to say about ANY volunteer group save your Scouting troop.

> Robesin has claimed that he can have me picked up on his say so as an LPN with a simple phone call from Tennessee. To another poster on RRAP, he claimed that "People who shoot off their mouths can have their tires slashed, rocks thrown through windows, and wives terrorized," but later clarified that all those bad things would be at someone else's hands.

Bigger sigh.

More of Brian P Burke's misquoting. I cited a news item some years ago where exactly that thing occcured.

Now for having mentioned it, Brain insists that I have made thinly veiled threats of a same nature.

An act of cowardice.

> A well known Amateur Radio store advertising in QST, whose ham daughter
> was featured in the ad photo, was said to be "selling something" but
> not amateur equipment.

More deceit.

Brain...WHY do you lie so readily?

> Robesin, whose father was a Sailor Army Recruiter (I swear thats not a
> typo), lays claim to seven hostile actions in the USMC, but who's only
> overseas assignment was Okinawa.

"Sailor Army Recruiter"...?!?!?

No Brain...let's get the FACTS right. My father served on Active Duty in the Untied States Navy during the Korean Conflict.

He was later an Active Duty recuriter for the US Army Reserve. Yes, Brain, SOME people DO serve in more than one branch of the Armed Forces than one...

And no, Brain, Okinawa was NOT my "only overseas assignment".

> There's more, much more, but if I went on and on and on you'd probably
> think I was making it up. I'm not. Google provides.

Much of what you say is not "made up"...Just quoted out of context or misattributed.

But mostly quoted out of context.

> > I've rubbed his nose in one
> > failed opinion after another.
>
> Yet it is your excrement on another man's genitals, according to your
> own original claims and subsequent quotes. Google provides, and you've
> requoted yourself numerous times.

That's not what I said. But you go right on ahead pretending it is as long s you think no one else can see it....

```
> >      So...There's my $0.02.  Do with it as you will, but I'd take a BIG
> > grain of salt with any traffic coming from "hot-ham-and-cheese", as you
> > are welcome to do with mine.
>
> Your $0.02 isn't worth two cents.  Google provides.

    Google provides evidence that any "opinions" uttered by you under
any one of your "anonymous" names needs to be taken with a grin of salt
the size of the Rock of Gibralter.

     As usual.....

Steve, K4YZ

Does Robesin always start off with a lie?  Apparently so.

In any event, I changed his forgings back to the original content.

> > Robesin is trying to
> > win you over by playing nice this time.  Unfortunately, the rest of us

>      Robeson DOES "play nice"...

Do I have to start another tally of your lies such as I had to do a few
years back?  What was it?  An average of 10 new lies a day for a week
before I gave up?

> Unless you blatantly lie to me or get
> caught lying about something that you should know better than to lie
> about.

No lies, Robesin.  You just don't like my opinions.
```

>   For example: Brian P Burke promising to keep certain information

> divulging that which he promised to not divulge.

There was no promise, and what you claim was a hostile action was
nonsense.

>   Hence the complete lack of respect for Brian.

Robesin has six other hostile actions. He says.

> > >   Brian has participated, along with Leonard H Anderson (unlicensed)

But that's not what I said. It's what you said I said.

>   You said several nasty things about "uniforms", "patriotic
> bunting", "ARRL sockpuppet", etc [words, by the way, straight out of
> the Leonard H Anderson playbook].

I don't use the phrase "sock puppet" or "ARRL sock puppet." I don't
think I've ever used the phrase "patriotic bunting," either. I do use
the word "uniforms" as in Robesin will do anything to get into a
uniform since his USMC career was cut short by some unmentionable
mystery.

Perhaps why Robesin claims that my statements are straight out of the
Anderson playbook is because Robesin is unable to distinguish a Hot-Ham
posting from an Anderson posting. His stupidity is not my problem, but
he tries to make it so.

>   Then came a series of hurricaines and tornaos to the south and
> southwest. All of them supported at length by ARES and RACES (among
> others, of course)

Do all amateurs have super-human abilities in Robesin-world?

ARES is a volunteer organization. It suffers from shortages of
manpower and equipment just as do non-volunteer response organizations
during an emergency.

>   Then came September 11th...Then came Hurricane Katrina...Then came

> Hurricaine Rita...Again, all agencies YOU claimed couldn't / wouldn't
> respond did exactly that.

Only Amateur Radio responded with exactly enough of everything?

Lots of agencies responded. Lots of News Reports about too little, too
late. Lots of Government Officials claiming too little, too late.
Lots of Citizen Victims claiming too little, too late. I don't know
how Robesin missed it, unless he was busy with that 1,000 yard stare.

>   We can then dig up your "unlicensed devices" rants, among others.

No rant. Unlicensed devices and cell phones handle most day to day
emergencies.

> > Robesin attacks when I reposted an article taken directly from the ARRL

Where is your evidence for making those attacks on me?

>   So far it's hit the mark (pradon the pun) with Mark and Toiddie.

Are you taking spelling lessons from Mark?

> The jury's out on you, but you cleaned up your act.

There is no jury. There's only Robesin and he is subject to the laws
of our nation.

> > >   My "MARS >>>IS<<< AMATEUR RADIO" comment refered to the fact that

>   And over 95% of Amateur Radio >>>IS<<< staffed by licensed Amateur
> Radio operators.

Had Robesin said, "Sorry Hans, Amateur Radio >>>IS<<< Amateur Radio"
there would be no disagreement. But that's not what he said.

Let's keep the focus on MARS, shall we?

> > Hell,
> > Robesin claims to have been chopped to an NMC MARS slot on Okinawa - as

> > I had MARS experience.
>
>   Yes, Brain, I know what the MOD is.

You do now, thanks to me.

> You've allowed yourself to be
> hypontized by Lennie's incessant repeating of that claim.

Unfortunately you find it difficult to distinguish my posts from
Anderson's. Here's a hint, try reading the headers instead of forging
them.

>   I was wrong then. I's wrong now.

Your grammar stinks. ;^)

> > > He doesn't want to repeat THAT part since it wouldn't serve
> > > his purposes. (to try and embarrass me)
> >
> > Except that I was an actual MARS affiliate and knew what I was talking
> > about. You didn't. Still don't.
>
>   Brian uttering yet again more mistruthful statements in a
> public forum.

Facts, Robesin, facts! Stick to them and you'll do OK.

> > >   He also claims that I am repsonsible for the "excrement eating"
> > > thread. That's a blatant lie. His "friend", Mark Morgan, KB9RQZ, is
> > > SOLELY RESPONSIBLE for the authorship of those subject lines and use of

>
>   The "excrement eating" posts belong to your "buddy", KB9RQZ. And
> the recent onslaught of re-tasked subject lines with exactly those
> words are HIS doings...Not mine.

Gee, you sure hate it when someone out-assholes you using your own sick
tactics.

>   Stop lying, Mr.

You originated the excrement eating posting, and you have since
requoted yourself for the sake of clarity, however, what you said was
far from clear. If you'd like to restate what it was that you said,
hopefully in a clearer way...

No, nevermind. It was sick enough the first time it came around.

> > >   Brain, of course, has NEVER owned up to any one of his own

>
>   No I don't know this.
>
>   I don't have Dave's logs.

So now Dave is lying?

>   However we are STILL awating some evidence of the validity of your
> claims of having operated legally from Somalia.

You'll just have to accept or reject my say so. Kind of like your
claims to seven hostile actions.

> > > misrepresentations about MARS, RACES, ARES, and other poorly

> > > conceptualized opinions that have fallen by the wayside as failing the
> > > test of evidence.

>
>   Sigh.

Indeed. Your shenanigans are archived in Google.

>   I guess we can only watch Brain continue to make a fool out of
> himself.

No fooling. It's all archived in Google.

> > >   Everyone's entitled to their opinions.
> >
> > Not true. Hot-ham is not entitled to an opinion, if Robesin has
> > anything to say about it.
>
>   Sure. Have an opinion.
>
>   But when you express it as "fact" and the "facts" don't bear up
> under the scrutiny of 3rd party reports to the contrary, don't get
> upset when you get "called" for your errors, Brain.

You post in absolutes..., for example, "Sorry Hans, MARS >>>IS<<<
Amateur Radio."

I pointed out that the Chief of Air Force MARS, at the time, was not an
amateur radio operator.

That single fact sunk your whole position on MARS as an amateur
organization, unless you want to argue the definition of "is."

> > > Brain's opinions of me are
> > > obviously low as he, despite having allegedly been a veteran himself,
> > > are anti-veteran and anti-volunteer.
> >
> > My opinions of Robesin are spot on.
>
>   Uhhhhhh...YOUR spots are usually little yellow rings on the carpet,
> Brain.

??? More Robesin lies? Stick to the facts, Robesin.

> > In addition to slinging accusations of homosexual and pedophilia at
> > those who disagree with him, I am now a veteran-hater and a
> > volunteer-hater. Nevermind that I am a veteran and a volunteer.
>
>   You hated them before, Brain...I am sure I am only the focus of
> your disdain in THIS forum.

Nope. You bring disdain upon yourself in your behavio[u]r toward
others.

>   You've not had a single constructive, complimentary thing to say
> about ANY volunteer group save your Scouting troop.

My comments were about people who are volunteers of multiple volunteer
agencies, and when a crisis occurs, have to support one agency and not
all. For example, you are a "professional" volunteer, committing to
the Tennessee State Militia, the Civil Air Patrol, ARES, MARS, and who
knows what else. And your professional position as an ER LPN should be
a high priority in your community. So when the claxon goes off, which
way do you run? Which volunteer organization(s) are left holding the
bag because Robesin overcommitted himself and really isn't super-human?

> > Robesin has claimed that he can have me picked up on his say so as an
> > LPN with a simple phone call from Tennessee. To another poster on
> > RRAP, he claimed that "People who shoot off their mouths can have their
> > tires slashed, rocks thrown through windows, and wives terrorized," but
> > later clarified that all those bad things would be at someone else's
> > hands.
>
>   Bigger sigh.

Yeh. Big, big sigh. Maybe if you just quit posting such nonsense....

>   More of Brian's misquoting. I cited a news item some
> years ago where exactly that thing occcured.

Here's a hint, next time you cite a news item, present it as a cited
news item and not as a threat. It's called "clarity," and you lack it.

>   Now for having mentioned it, Brain insists that I have made thinly
> veiled threats of a same nature.
>
>   An act of cowardice.

I perceived a threat. In Robesin's own words, one has only to perceive
a threat for there to be a threat.

> > A well known Amateur Radio store advertising in QST, whose ham daughter
> > was featured in the ad photo, was said to be "selling something" but
> > not amateur equipment.
>

>   More deceit.
>
>   Brain...WHY do you lie so readily?

Google provides.

> > Robesin, whose father was a Sailor Army Recruiter (I swear thats not a
> > typo), lays claim to seven hostile actions in the USMC, but who's only
> > overseas assignment was Okinawa.
>
>   "Sailor Army Recruiter"...?!?!?
>
>   No Brain...let's get the FACTS right.

Yes, yes, finally!!!

> My father served on Active
> Duty in the Untied States Navy during the Korean Conflict.

>   He was later an Active Duty recuriter for the US Army Reserve.
> Yes, Brain, SOME people DO serve in more than one branch of the Armed
> Forces than one...

than one...

OK.

>   And no, Brain, Okinawa was NOT my "only overseas assignment".

Then the only thing remaining is a small matter... PROOF.

> > There's more, much more, but if I went on and on and on you'd probably
> > think I was making it up. I'm not. Google provides.
>
>   Much of what you say is not "made up"...Just quoted out of context
> or misattributed.

>   I guess your English comprehension skills are as incompetent as
> Morkie's.
>
>   That's not what I said. But you go right on ahead pretending it
> is as long s you think no one else can see it....

What scares me most isn't that you made a mistake in your grammar when
posting that sick nonsense, it's that you posted the sick nonsense at
all.

It is grossly off topic and has no place in an amateur radio discussion
newsgroup.

I certainly hope that Paul Schleck agrees.

```
> > >      So...There's my $0.02.  Do with it as you will, but I'd take a BIG

I don't much like the receivers I've used in contemporary tranceivers -- the general coverage synthisized open front end ones. (I hasten to add I haven't used any of the $4000 rigs; can't afford them). But the ones I have used seem plagued with near-signal desensitization, front end overload, etc., and I suppose all that comes from putting the selectivity so far downstream.

I'm almost tempted to get an old 75s4 and shut up, but I really don't need another room heater, so, instead, I'm thinking of building my own receiver along the lines laid down by the late Doug DeMaw in his _QRP Notebook_. Single conversion 160m superhet with Collins mechanical filters in the IF and a series of down-converters for the other bands. Anybody got any experience with the DeMaw Design?

Jim, K5YUT

I think the main issue with the contemporary transceivers is covering DC to daylight and trying to make the thing work. A single band design seems to be a lot easier to make bulletproof.

Modern QRP design has advanced a lot since the DeMaw days, even over the venerable 75s4. Take a look at designs by K8IQY or AD6A or N7VE and you will find receivers that will be head and shoulders beyond anything that

W1FB ever dreamed of.

The front end overload issues on simple receivers seems to be largely related to the use of the 602/612 mixer. The passive mixer, or Tayloe mixer, designs seem to fare much better. The Elecraft K1 is the exception that proves the rule; I suspect careful gain management may have something to do with that.

KK7B has also written a LOT on receiver design, and his designs have a good rep, but I've never used them so I can't comment from experience.

Doug's designs are fun, and sort of nostalgic, but if you are looking for 21st century performance, it isn't the place to look.

..

There are many variations on this theme. There are two camps here, the Collins version was a 160 meter first IF with a 455 khz second if. The Drake version was an 80 meter first IF with a second if of 455 khz, and a third if of 50 khz. So you have the 75S series vs the 2B series.

Lafayette radio's famous HA350 used the 2B method as did a home brew rig in the '67 handbook (both without the 50 khz if, they used a Collins filter.)

I've been thinking of building something along these lines to make use of some 85 khz ARC-5 IF cans in the junk box. You'll get somewhat better image rejection above 20 meters if you use an 80 meter IF instead of 160, but otherwise either IF scheme is ok.

Yet another idea is a single conversion with a 9mhz IF. Since I have a bunch of surplus 9mhz filters (they are 8 pole units with 3.2 khz bandwidth) I was also thinking of a rig with these. True the filters are a bit wider than common today, but if I put THREE of them in cascade (between IF stages) they should do a good job. I would use a DDS VFO, but would also used a tuned (not broadband) front end. I have enough toroids and multi section variable caps in the junk box for that. I

also have some old tv turret tuners that would make a good band switch
for the front end (put the toroids on the tuner strips). I have lots of
J310 fets, so I'd use them in the front end as well.

Try Drake R4B and Softrock tuned to the first IF 5645 (?) you will get best
of both worlds. Switching before and after filters gives more options.

>> veiled threats of a same nature.
>>
>>   An act of cowardice.
>
>I perceived a threat. In Robesin's own words, one has only to perceive
>a threat for there to be a threat.

that only applies to Robeson not his victums

Icertinaly precieved a threat when in 1998 he finished a long about
guns and marksmenship with "one shot one Kill even in illiopolis"
where I lived at the time. and ofcourse my father picking up the phone
and hearing someone say I am going to kil you mark" roudn the same was
in way threatening and calls to local postal office and police station
asking where I lived wasn't threatening

you were lucky steve that Illiopis was so poorly served by the Phone
service that you calls could only be traced to AC

But then you're just recreating something that is open to problems.

That sort of scheme was used to get a constant tuning range over each band, and because synthesis wasn't easily applied.

But on anything other than the core band, you've got double conversion that moves the selectiving past two mixers. And unlike current up-conversion schemes, there is not even a crystal filter of some sort at the output of the first mixer.

Switch to an IF in the HF range, and you immediately eliminate most image problems. No fussing over the front end about that, and of course, you won't have to have the front end tracking the tuning oscillator.

Remember, a whole wave of amateur transceivers and receivers went to that sort of scheme. And unlike general coverage receivers, you don't have to worry about any problems due to the IF being in the tuning range, and you can think up various schemes to do the tuning since you don't have to cover the 30MHz.

YOu can stick with the modular theme, and thus build only for the bands you want or even build a band at a time. But instead of a whole converter, you'd have the preselector circuitry (and maybe an RF stage) and the variable oscillator for each band. Or build a good receiver up till the input of the mixer, and then figure out what comes next.

IN the sixties, that wave of single conversion to IFs in the MHz range used various schemes to deal with the local oscillator. Obviously some bands needed a frequency range that could easily be supplied by a variable oscillator without drift (and some of the rigs took that to the extreme and used the variable oscillator directly on 10metres). The problem with bandswitching the oscillator would of course be the issue of getting it to tune only 500KHz or so on each band (and any stability issues caused by the switching of the LC circuits).

Other rigs used pre-mixing, so the variable oscillator would always tune a fixed range, but it would be converted to the needed frequency with a mixer and crystal oscillator. One does have to watch out for spurs on the output, but it gets the extra mixer out of the signal path, and given a relative handful of 500KHz ham bands in the shortwave region, the cost of the crystals wasn't out of range (though maybe today..).

Then later, some rigs used PLLs. I can't remember if the Signal One used one, but certainly in the seventies they came along. Same basic idea as the premixer, but the PLL was the filter so the VCO directly fed the receiver's first mixer.

Rigs like the TS830S used a PLL for that same purpose, though they came up with a pretty fancy scheme to limit the number of crystals needed.

One of the things about receiver design is that the trends have often reflected limitations of the times. There may be a good reasons for doing things a certain way (such as adding a third conversion to a receiver so the BFO is on a different frequency from the one where the main gain is), but it may also mean they couldn't do anything better at the time.

Michael VE2BVW

Well the CX-7 didn't use a PLL, but the CX-11 did. It was however only for generating a comb frequency to be used with premixing. The analog PTO's still tuned 3.1 to 4.1 MHz.

The main problem with up conversion is the hit you take on oscillator phase noise. These days, with the advent of the "H" mode mixer, oscillator phase noise and birdies are THE limiting factor in receiver compromise.

Well, after much hair pulling and gnashing of teeth, I managed to download the 15th edition of Radio Handbook last night. No straight receivers that use tubes, though. Going to have to look at the math section to see if there's some way I can work up a schematic of my own. Thing is, math isn't my strong suit.

Also going to have a look at some of the older books. If worse comes to

worst, I know of a few places online where I can buy the tube that are
in the schematics I do have.

Ralph

Nothing too complex, two tubes or so. What I want to build is something

that looks like it's from a 1950's Cold War era post apocalyptic story.
I definitely want to use tubes, and I have some headphones from that
era as well. The receiver has to be able to drive the headphones. They
are NOT crystal headphones.

Fascinating, but I didn't see anything close to what I'm looking for.
Thanks anyway.

I've heard that DDS units do NOT have the phase noise problem that
conventional oscillators do. DDS does generate spurs, but if you can
find a DDS that will allow for a clock rate many times the desired
output frequency the spurs a far out of band. The Analog devices AD9954
family of DDS chips have a max clock rate of 400 mhz. If you do NOT use
the on board PLL multiplier and clock it externally from a good low
noise clock, you can overclock these chips to as much as 600 mhz!
So if you up convert to 70mhz you'd need a 100 mhz local oscillator at
10 meters. Thats 1/4 the clock (or 1/6 if over clocked).
With a 45 mhz first IF even better.

BTW I had an idea for a rig up converting to 6 meters as the first IF.
This would be dual conversion on the HF bands, though a crystal filter
at 6 meters for a fixed first IF would not be impossible here.

I don't recall the url but I remember a 2-3 tube receiver from the 40's
that might be what you want.  It was a simple superhet with a
regenerative detector.  Used a 6k8 as the converter and a 6c8g as the
detector / audio.  It drove a pair of magnetic phones.  The set used two
plugin coils, one for the antenna circuit and one for the oscillator.
Each antenna coil served double duty as the oscillator coil on the next
```

higher band (moved the antenna coil from the antenna coil socket to the oscillator coil socket and put a new coil in the antenna coil socket to change bands). There is a variation that added a 6sj7 as the detector and the other half of the 6c8 became a bfo.

This first appeared in Feb 1941 QST. The details are on the web someplace, google for it.

I recall reading that the SA602/605's were discontinued and replaced by the '612/'615. Because of demand some of these were relabeled and sold as 602/605's to satisfy customers who didn't believe that the parts were interchangeable. They are.

If you hadn't noticed, Mark is "Out-Assholing" Robesin. He's doing a
damned fine job of it, too.

> Mark is far from "normal", too. Billy Smith already knows that....

Everyone has issues, but there's no need for Robesin to scour the
internet and bring stuff back to RRAP that has no place on RRAP. But
thanks for asking.

I would suggest this one ( http://www.intio.or.jp/jf10zl/17ew8.htm )
would be a good starting point.  It should work with most standard
double-triodes (12AX7, 12AT7, 12AU7, 12SN7, etc.) or two single triodes.
  (6C4, 6J5, etc.).

This one ( http://www.intio.or.jp/jf10zl/12au70v1.htm ) could also be
adapted - use more than 12 volts on the plates and put a ~5k:8-ohm
transformer in the plate of the second tube (instead of the R-C network)
and it should do what you're trying to do.

They were called "supergainers" and apparently Frank Jones, of later
VHF fame, was a big proponent of them in the thirties.

The earlier Radio Handbook on that webpage someone posted about would
have them, the 1936 version or whatever.  I didn't suggest downloading
that one since I had the impression the tubes available to the original
poster were miniature, and the book predates those.

Robesin draws a disability pension, yet he is an ER nurse. How can an
ER Nurse be disabled?

> >>   My "MARS >>>IS<<< AMATEUR RADIO" comment refered to the fact that

>
> he might have been in MARS , which does not mean he understood anything
> about though

He probably just liked listening to the wives on the MARS phone patches...

Anytime anything starts to go wrong for Robesin, he has to get to the wives...

He started in with Len's wife, then your wife, then my wife, then his gratis UP attorney's wife...

> >>   He also claims that I am repsonsible for the "excrement eating"

Thanks, Mike, Ken. I'll have to take a look. I did manage to download
some of the files on designing circuits with tubes, and with the online
tube manuals I might be able to figure out something on my own. Still,
if anyone can think of where I can find something already made up that
I can use, I'd appreciate it.

Ralph

Oh, nearly forgot....
With a little head scratching, you can replace the 6K8 with a 6u8, 6ea8,
6x8 (etc) triode/pentode. Use the pentode as the mixer and the triode
as the oscillator. In many cases the inter-electrode capacitance inside
the tube will provide enough coupling from the oscillator to the mixer,
but you might need to use a gimick capacitor (twisted wires) from the
pentode grid to the oscillator plate. Other tricks are to connect the
pentode screen to the oscillator plate, or in the case of the 6x8, the
pentode grid 3 to the oscillator grid.

The 6c8 may be replaced by ANY dual triode (such as 12au7, 12at7, 12ax7,
6sn7,6sl7, etc....)

```

The DeMaw designs are very nice but with their band-wide converters
they also suffer from having selectivity downstream rather than at the
front. Preselection at the front helps with any of these.

The modern choice of a 45MHz or so first IF is really pretty nifty for
a general coverage receiver from the past couple of decades. Lack of
preselection can be largely cleared up by bolting something before the
front end, and indeed many of the receivers you see that cost as much
as a car have tracking preselectors.

But if you don't want to upconvert, as I see it you have two choices:

1. Don't even try bandswitching. Coil sets for each band. You end up
with the HBR-16, a very elegant and homebrewable receiver.

2. Do bandswitching but with elaborate tracking front end (and if
necessary a tracking IF, but with modern synthesizers you probably
wouldn't), probably with many switching sections to handle the required
octaves. You end up with a R-390A.

Tim.

One reason there was that phase with a separate converter per band ahead
of a receiver tuning a fixed band was to avoid switching tuned circuits.
By that time, the semiconductors cost so little that it was easier to
duplicate them for each band, and then the bandswitching becomes so much
easier.  No fussing about getting close to the tuned circuits, you simply
switch the "B+" and the input and/or outputs.  Or, make those
converters plug in, and then no switches required at all.

I sort of alluded to this in an earlier post.  Make a good receiver,
minus the variable oscillator and the front end tuning.  Maybe even
put the mixer in the "plugins".  Then you end up with a good receiver
that is quite flexible, because the things that you may want to play
with and may give trouble are in a separate box or plugins.
```

YOu can even play with things like tuneable frontends versus something
that is broadband across a ham band. Some bands might interest the
builder more than others, so they could build a really good plugin
front end for that band, and lesser front ends for other bands, or
leave off the bands they aren't interested in (but those bands
can easily be added later, unlike a bandswitched rig).

IN the sixties, there was a guy who had a whole slew of receivers
described in CQ. Virtually all of them were single bands, and he
made the point that it left off bandswitching, and of course he
could choose an IF that better matches the tuning range. Good points,
but an awful lot of duplication. Build a good receiver first,
and then play with the frontends endlessly.

   Michael VE2BVW

I think we may be in business, here. Went through my selection of
tubes, and there's a 6X8 and a 12AX7A among them. Three other tubes
looked like they had promise - two 12AV6 and a 6BU6.

After I'm done with this post, I'm going to Google Images to see if I
do indeed have 2000 ohm headphones. I want to make sure, because
elsewhere I found a crystal shortwave radio that uses them as well.
That might serve my needs better, although it won't have those cool
glow in the dark tubes.

Ralph

```

After using Google images to track down pictures of 2000 ohm
headphones, I am satisfied that those are what I have. (Eight sets, in
fact.) Found out the one tube is a 6BJ6, not a 6BU6, but it does still
seem usable. Going to ask if I can make some trades with tubesandmore,
so I can find a good home for some of the headphones and possibly get
the tube sockets and transformers I need for my project.

Thanks again to everyone who has helped. Time for me to go do some
math. (Ugh!)

Ralph

Today, I am reminded that Google is my friend. After much digging and prodding, I found what I was looking for. It seems the National SW-54 receiver is as close to what I want as possible without me having to do math. It dates back to the 50's, uses tubes, (in fact, I already have three of the five in it) covers a good amount of the SW band, and will drive either my 2000 ohm headphones or a 4" speaker. BAMA had the manual, but it wouldn't give it up, so I had to go to the mirror site to get it. Everything I need is in it - schematics, parts list, pictures of the assembled receiver. Not exactly the ideal radio for a first try, but nothing good ever came easy, did it? ;-)

Thanks again to everyone who offered advice and suggestions. I'll be sure to post when I have it together and let everyone know how I made out.

Time to scrounge for parts.

Ralph

I'm partial to KK7B's stuff, since the less you mess with the
signal turning it from RF to audio, the better it sounds.
And if you *want* to mess with it, you've got a better
place to start.

My best shack receiver is a Harris RF-590. A genuine
professional military/industrial/spook radio, rack mounted,
weighs a ton, megabucks new, but reasonable if you can
get one surplus. If you can't hear it on this radio, you don't
need to hear it.

You can just measure the resistance of the phones with an ohm meter.
The result will be close enough to the impedance (I think in the era
they were made they didn't even measure impedance, just the resistance).

Also, I have a lot's used 12au7's. If you need a few you can have some
for the cost of postage.

Ocean State electronics has EXACT replacement coil forms for the beast.
(sockets are another story!)  They have NORMAL socket type plug in coil
forms too.  (the national coil forms have different pin spacing than
standard tube socket type coils).

OPPS, I confused the sw-54 with the sw3-5 series.
This one is a "modern" superhet. Do you have the IF transformers, band
switch and coils?

I have a complete band switch and coil assembly from an old Lafayette short wave receiver. It is a 4 band assembly with rf, osc, and mixer coils intended for use with a 3 gang 365pf/section tuning capacitor. I was thinking of using this in some project (that never happened), but it sounds like just what you want. The coils have slug tuned tracking adjustments, and the oscillator and mixer coils also have trimmer capacitor tracking too.

If you can use this let me know.

PS, if you use this you'll have to change the tube lineup to take full
advantage of all the coils. Replace the 50c5 with a 35c5 and add
another 12ba6 for an rf amplifier. Actually you should use all 6v tubes
and a power transformer. Those AC/DC sets are "undertakers labs"
approved shock hazards. An "isolation transformer will fix that of course."

The schematic of the receiver the coil switch assembly came from is here
http://bama.edebris.com/manuals/lafayett/ha700/

I'm starting to think I should just settle for that crystal shortwave set I found on the Antique Radio website. Less headaches.

No idea where to get the coils for the SW-54, so I guess that's out. Besides, since this is my first real attempt at making a radio, I should probably go for something simpler.

Going back to Google to see if I can find more on some of the tubes I have. I keep thinking I should be able to make a regenerative receiver with some amplification with the two 12AV6 tubes I have.

Ralph

Huh?

I've seen this exact reply to many posts on many ham newsgroups. If you disagree with the post, aren't you providing a "reply" to these "supposed" spammers? I think you're being a bit anal here. Most people with repeaters (even commercially made ones) have to do a bit of homebrewing to get them on the ham bands (controllers, id'ers, etc.).
It sounds like what you want is more specific newsgroups such as rec.radio.amateur.homebrew.vhf.2M.repeaters.motorola.msr2000.boards.replacement.PA.versionB

Lighten up. You don't HAVE to read these posts and this one had a very clear subject right in the subject line.

Single conversion 160m superhet with Collins mechanical filters in the IF and a series of down-converters for the other bands. Anybody got any experience with the DeMaw Design?
>
> Jim, K5YUT

Jim,

I recently went through what you are now doing. Get a copy of EMRFD and read through it.

I built up a DDS vfo that I could use from a few khz up to about 20mhz. I put it in a well shielded enclosure to minimize spur pickup. The one I built also has an lcd readout and keeping that in the shielded enclosure keeps noise down in the rest of the receiver.

I then built up front end bandpass filters for just the ham bands and worked with them till I was happy with their performance.

I then picked up surplus crystals off of ebay. Get 100 of the same kind if you can. The hc49 units I got seem to work well. Then build up the crystal filters you need and get them working.

I then built up an IF using a 1496 ic and the crystal filter.

Then I built up a mini-circuit sbl1 mixer and started hooking things together. The mixer needs a good diplexer arrangement to do its best. I spent some time getting that built up. I learned quite a bit about interstage impedance matching. I used iron core toroid transformers to do most of that (e.g. btwn the mixer and filter and btwn the filter and the IF amp.

Add in a simple product detector and a *good* audio stage and you are all set.

The receiver hears at least as well as my icom 751a. It doesn't have passband tuning (and likely won't) or a notch filter (I have plans to add an audio notch filter) so it isn't quite as good in a crowded situation.

But it *is* simple and easy to work on.

Oh, I almost forgot. I wound up building up an RF amplifier to enhance the receivers sensitivity and added a switchable 20db pad to help with overload situations. I also used a set of latch relays to control everything with a whole bunch of pushbutton switches on the front panel. The relays were expensive but work really well.

Anyway, I think you can build a single conversion receiver that will be quite adequate even compared to todays equipment. Give it a try!

There is no "rec.radio.amateur.swap" It's rec.radio.swap

The original post went to:
  alt.ham-radio.marketplace
  rec.radio.amateur.boatanchors
  rec.radio.amateur.equipment
  rec.radio.amateur.homebrew
The first is the only one where it really belongs. Maybe .boatanchors, since when they created it they allowed for ad, though the intent was not a general buy and sell newsgroup and neither was it truly meant as simply a buy and sell newsgroup for boatanchors. It was meant as incidental to the discussion of boatanchors, so people having discussion might post ads, as opposed to people who merely use the newsgroup to buy things.

rec.radio.amateur.equipment is for the discussion of amateur radio equipment, and was never intended as a buy and sell newsgroup. The fact that bozos post their ads is not relevant to what the newsgroup is about.

Same with rec.radio.amateur.homebrew If anything, ads are even way further off topic, given this newsgroup is about building.

And you're notion that "If I was looking for a replacement part, I'd want to post somewhere where it had a good chance of being seen." is precisely why we see so much cross-posting. People who can't figure out where their post belongs hits all kinds of newsgroups in the hopes that someone will see it and they'll get a reply. It make no difference whether someone is buying or selling something, or it's those silly feud posts; they've all decided that what they want is more important than what others want. That's the very notion of spam, hitting lots of newsgroups (or email) in the hopes of getting a response.

People too often are misled by commercial advertising. We see it on broadcast radio, in the newspapers, and on tv, so it becomes acceptable. But what's missing is that advertisers in old media pay for their bandwidth, that they help to deliver the content. That is never the case when someone hits the newsgroups or email. All they pay is for their internet access, and the newsgroups and email would survive without them. So the acceptance of advertising in old media is no excuse for advertising/spam where it doesn't belong in the newsgroups.

------------ REPLY FOLLOWS ------------

Wanting to buy a spare circuit board has to do with repairing, not homebrewing. Homebrewing means building a new piece of equipment essentially from scratch.

Rec.radio.amateur.swap is very lightly used. I'd recommend
rec.radio.swap.

Name: Kirill
Call: VE3AXC

Merry Christmas and Happy New Year everyone! I will be a subscriber of this forum from now on, so nice meeting everybody!

On this note, please allow me to stray a bit off this forum's topic but my info might still be relevant for some. I myself have been a ham for 8 years; also run a small QSL card printing business (my printishop is located in Toronto, Canada) and have a web site specifically dedicated to that www.qslcanada.com

Reason I would like to post this message on this forum is to let your group know that I have a pretty good group referral discount program.

The idea is quite simple and there is no catch.... For each HAM who is referred by you and who wishes to place an minimum order of 500 cards, you would receive 100 (custom designed) cards of the same type free of charge. The offer is transferable, so if for example you let me know that you don't need any more cards, I will be happy to print additional 100 cards for your friend free of charge (or charge for 100 cards less)

This offer may be ideal for your group or a club you belong to. For example, if you
refer say 3 HAMs who would like to print a minimum 500 cards for themselves, you would receive 300 cards as appreciation for spreading the word about qslcanada
; you could transfer it to someone as a gift ; or each of 3 Hams would only pay
for 400 cards, since each one will get 100 cards free. To sum it up, each of the referral counts as 100 free cards in any shape or form.
Pse let me know if you have any questions.

So if bunch of Hams in this group who are into QSLing might be interested to giving someone a free gift or getting a good deal on the next batch, pse let me know. The offer is valid any time in future.
www.qslcanada.com has quite a bit of samples, more info and e-ham reviews

PS Have got to mention this, since it did happen before, where some folks took this posting too personally. I just wanted to get this info out there ONE TIME ONLY! Please don't call me any spammer names or hate mail me. I believe this to be a fair group offer any hams by hams enterprise deserves a little exposure to start out with.

I will try to participate in this group from now on; best 73 to everyone and Happy New Year!

Managed to find a regenerative receiver based on the 12AT7 tube. I've
been told I can substitute one of my 12AV6 tubes without a problem, so
that looks promising.

I have some twin triode tubes, as well. (6FQ7, 6BZ7 and 4BC8) I've been
wondering if I couldn't make some one tube receivers with them. (Use
one triode for regeneration, the other an amplifier.) As for the rest
of the tubes I have, I'd be willing to sell or swap for parts I'll
need.

Ralph

There was a project to design a REALLY good sigle conversion ham radio and here is the website:

http://www.warc.org.uk/cdg2000/The%20CDG2000%20Transceiver.htm

It was designed to have a fantastic dynamic range and, after seeing some of the schematics, it has quite a few good ideas. The mixers and crystal filters are worth studying.

One of the designers made a helical coil VCO with really good phase noise, although the mechanical details were complex.   These days, I'd want to look into the AD9954 DDS design.

Probably still have to do something about DDS spurs, but they are fairly low as is.

==================

So, it seems to me that there are a lot of designs for homebrew gear. You need to look at your specific requirements to see what will suit you.

In my case, I live in a very RF HOT location, with quite a few powerful signals.   I might take the extra effort to go for maximum dynamic range. Probably ovekill for most ham locations, but necessary for me.

Guys, this is has been an interesting discussion. I wish I was more
knowledgeable - I would venture out building like that but I just don't
know enough.
---
I'm kind of starting over. Long story...
What would be a good receiver - or good enough to listen for VFOs, test
and build, etc.
Or better yet what should I avoid?
What about something like the Ten-Tec 1056 kit and some way to band
switch - maybe modules...
It's kind of a catch 22 - I have to have a receiver to build one (or
transmitter).

Dan KB9JLO

I think this link might be more helpful and cheaper.

http://dzabcik.home.texas.net/doerle.html

Of course, it doesn't have Lindsay's notes on using newer tubes.

Ralph

Well, for a reasonable starting point, the KK7B line of direct conversion radios has a lot going for it.   Good performance in a small package, and it can be set up for most frequencies by providing an LO nad a 90' shift for the LO in the band you want to play with.

A kit can be purchased from Kanga which has all the parts needed.   They also offer the microR2 which was in the recent QST article.

http://www.kangaus.com/micror2_receiver.htm

That particular kit is set up for 40 meters, but it'd serve as an excellent starting point.

Kanga also has the slightly more general purpose miniR2 the does not ave an onboard VFO, so it is easier to use on other frequencies.

The R2 series have good dynamic ranges, and make pretty good rigs.   No AGC, which takes some getting used to, but fun to use.

Jim   N6BIU

Oh come on, whatever your security problems, whatever your need to
be a pedant, get it sorted and find some real issues to deal with.

If I was looking for something a bit unusual then a group of
homebrewers is one the first places I would try. Your definition of
this group is far too narrow, surely it also includes fault
finding, problems and repairing. The common link is that these are

things we do ourselves rather ran to the nearest shop.

I just wish I had a spare board to offer :)

Charlie.

I just tuned into this News Group to find some and not all ham's like to speak better of there self's than they act.

I thought that was why people became Ham radio Operators and had gotten away from C.B. God I hate that C.B. I get sick thinking about it. I've been a S S B Radio Operator for a long time. Yes I prefer to that think that there are Three types of Radio. No need to go there and get my but kicked by the know it's on here. It has been said so many times no matter what the Hobby. There is always someone out there trying to take the fun out of anything good. And I just seen some of them here. I have been wanting to become a Ham operator for I'll bet at least 35 or 40 years. The code has always stopped me. And the But head's and those with attitude Overly goody two shoes crowds. I have a learning disorder. It does not make me retarded, it simply means that I learn better for me in a hands on manner. Code is plainly just to much for people like me.

Now My point to all this is once again I'm hanging on a tread, I just don't know why I would want to go into Ham and put up with these too kinds people when I'm already doing it and I don't like it any better now. The only plus that I can see at this point is more Frequencies. Ham was a Hobby that was intended to be HELPFUL IN ALL OF IT'S ASPECTS..........

Now look what it's coming to. Some don't want the no Code, other's do and if they remove the code I'm afraid it will let in all the nut's .Well my friends you folks all ready have them. And in the mean time your keeping Good honest people out. Honest people aren't Born........ It takes a Very strong willingness now days to be one.. Ask me it's hard and we don't always win so . Your art form, your hobby no matter what your calling it today is steadily going by the way side. And some of you are so caught up in yourselves that you just can't see it. Some of you are the Sign of your time. I'll Bet there are a lot of old timer's just shaking in there Graves at the way you have been presenting the hobby that they helped to grow. Kind people used to run the Ham band's and there are still some out there are you one of them. Or do you just think you are Action's speak louder and farther then the Air waves. I'm not even a Hammer and I can see that...... I'll be listening......

Well If you are familiar with the book you know he showed a version
using a 6sl7gt tube. The 12at7 triode is identical to one half of the
6sl7 (except for heater voltage) so you can use a pair of these tubes in
the same circuit.

I built the #19 version, which worked ok but this tube is VERY
microphonic. I suspect the 12at7 will not have that problem.

Another interesting version of the theme was a single tube regen that
appeared in 'poptronics. It used a 6af11 compactron. This tube has two
triodes and a power pentode, so it will drive a speaker.

Also the current issue of QST shows a very simple untuned rf amplifier
that can be added to any tube type regen receiver. It uses only 7 parts
(a resister, 3 caps, 1 diode, an rf choke, and a transistor). The rf
choke and one of the caps can be eliminated if you directly couple the
output of the rf amp to the receiver via a link added to the input coil.
One of the caps and the diode are used to steal 9v dc from the 6.3v
heater supply. I would recommend adding this as it makes the receiver
easier to tune by isolating it from the antenna.

opps I meant 12at6 tube.

I bought one of these kits to make use of a sample AD9851 chip I got from Analog Devices a few years ago.

http://www.amqrp.org/kits/dds60/index.html

I knew it was hopeless to bread board something with this chip, but even with a PC board soldering something with such close lead spacing is a challenge (especially when you're past 50 with failing close in vision and less than rock solid stable hands). Still I figured I'd give it a try. Armed with the smallest soldering tip available for my Weller PES51 soldering station, a good magnifier lamp AND a binocular microscope I gave it a try to solder the chip to the board.

Well there is good news and bad news. The bad news is that it is impossible to solder the chip by hand without creating solder bridges. The good news is that I did a good enough job to get the chip 99% perfectly centered on the solder pads, and you can remove the solder bridges with solder wick without removing the chip from the PC board.

It would have been easier with thiner solder (I had .021" dia solder) and a thiner soldering iron tip, but inspection with the microscope shows no shorts, and it looks like all the pins are properly soldered. Naked eye it doesn't look pretty but it should work.

Now to solder those chip caps and resistors! (They should be easier, the AD9851 was the worst part to place with the tight spacing, all the other parts have lead spacing at least twice as wide).

I've seen people recommend this as the preferred hand-soldering
approach for dealing with small-pitch surface mount parts. Don't
worry about creating bridges... use a bit of liquid flux on the pins,
get a nice blob of fresh solder onto the tip of the iron, and then
just gently drag the molten solder-ball along the pins and get them
soldered to the traces. Then, go back over it with solder-wick and a
bit more liquid flux, and wick away the excess.

I did smear the pc lands under the chip with paste flux first.  Not a
heavy coat, just lightly applied.  It does help.
I've watched the technicians at work hand solder even finer pitch chips.
 One young woman has very good close in eyesight and works without a
magnifier.  She does have to clean up with the solder-wick, but makes
machine like perfect solder connections.  (she makes it look EASY!)
Whats hard is doing an entire board in one sitting without getting a
visual version of writer's cramp. (eye strain)

A good receiver is important in any ham shack.

You can build state-of-the-art performance, especially for a single-band receiver. While some have talked about DDS/PLL VFOs, don't underestimate the performance of a good LC VFO built with modern components, after a bit of tweaking to nail down the temperature compensation.

I know you have your heart set on building something, and there have been excellent suggestions in this thread, but it's not a crime to buy your first receiver to give you a known-good building block for further development.

>Yet another idea is a single conversion with a 9mhz IF. Since I have a bunch of surplus 9mhz filters (they are 8 pole units with 3.2 khz bandwidth) I was also thinking of a rig with these. True the filters are a bit wider than common today, but if I put THREE of them in cascade (between IF stages) they should do a good job.

A single 9 MHz IF filter unit with I/Q detection (to handle the opposite sideband) could be an other alternative and do the rest of the filtering in audio stages.

>I would use a DDS VFO,
>but would also used a tuned (not broadband) front end. I have enough toroids and multi section variable caps in the junk box for that.

The _unloaded_ Q values shown by toroid manufacturers are not very spectacular (in the 200-300 range at most). If you aim for a filter loaded Q of 100, there are going to be a considerable loss (several dB), so placing the filter before the first RF amplifier stage will deteriorate the noise figure quite badly, which can be a bad thing on upper HF bands.

With a preselector loaded Q in the 50-100 range would still cover an entire WARC band without tuning and with wider bands and tunable front end filters, a 100-500 kHz segment would still be present at the mixer input at full amplitude. Thus, the mixer would still need to be strong to handle all those signals in that range.

A preselector filter will most definitively help in keeping out strong broadcast band signals (e.g. the strong 49 m BC band in Europe) from the mixer, but it does not help much against strong amateur signals in the same amateur band.

One thing you might try "next time"...

Pre-tin the PC pads by heating them with a heat gun, (being careful to not overheat the board) and applying a very small amount of solder to each pad. If you can get the IC pins all lined up with their PC board pads, tack solder one of the corner pins (or one that is easiest to solder without bridging). Use a toothpick (or some other device) to apply gentle down pressure to the IC to keep it from moving. Use the heat gun again (carefully) until the solder melts and the chip should "settle" down into the molten solder. Keep the heat gun moving around all pins to be sure all get down into molten solder. If you happen to have a piece of copper clad PC board, you can practice by putting some solder blobs on it and putting the leads of some sort of junkbox parts on to the solder and heat it up with the heat gun, apply the down pressure to the component and you can get the feel of how far the heat gun should be away from the board and the length of time it takes to melt the solder...

It's MUCH easier to begin with the easy parts! Start with the largest
chip caps and resistors, continue with the rest of the simple passives,
and then the largest ICs (largest pin spacing).

Finally, when you've honed your SMD skills, solder the large ICs with
the small pin spacings.

And give up the industrial-strength coffee for the duration :-)

You did not say what an 8640B is. Signal generator? Transmitter? Power out?

Main thing is to get the "forward" power to read something on the meter (preferably full scale, but even if you get half or quarter scale, then you are able to get a rough idea of usabiltiy of the meter). Then see what it shows on the "reflected" scale. Figure ver roughly if the reflected power is half the forward (regardless of the actual location on the meter scale), then you have about 3:1 SWR. Turn the meter around to get an idea if the diodes (and associated circuitry) are well matched for forward and reflected.

I have used a number of el-cheapo CB SWR meters even up on two meters and they work surprisingly well, even more sensitive than ham SWR meters for VHF-UHF, and not that far off of what the ham SWR meters report, and so are good for handie-talkie measurements. So, yes, you should get useful ball park figures.

Lab-grade RF signal generator, official range from 500 KHz to 1.024 MHz. In practice it's good from 455 KHz up to about 1.2 GHz. Includes FM, AM, and pulse modulation, with either internal modulation at variable frequencies and amplitude (AM) or deviation (FM) or external modulation. Has a very nice 6 1/2 digit counter good up to 1.2 GHz. Output range is from -130 dBm (100 nanoVolts) to +20 dBm (3 Volts) into 50 Ohms.

It's a _very_ nice piece of gear indeed. You can see a picture of mine (and other stuff on the workbench) at

<http://mikea.ath.cx/testgear/index.html>.

That's good to hear. I got to thinking about what an MFJ-259 or -269
does, and decided that I only needed a sensitive-enough SWR meter that
would give reasonably accurate readings from 100 MHz to 1.2 GHz, since
I already had the signal source. Of course, the HP 8640B weighs about
40 pounds, and is a good deal less portable than the MFJ products, but
if I can get this working, I'll be able to do things it won't.

>> running the signal through
>> the SWR meter to the antenna? Or am I way off in left field?

Looks like I'm well inside the ballpark and that I have some design
and construction to do. This should be fun.

Thanks!

I don't think using your 8640B as a signal source to read on a wattmeter is going to cut it. +20 dBm is only 100 mW. Unless you have a wattmeter that has a 100 mW or so range, you aren't going to get much needle deflection. The lowest range on my Telewave wattmeter is 5 Watts.

Agreed. I'm looking at some RF log-amp chips from various places and
some RF sensor chips I saw in a construction article I can't locate
right now, so that I can get something useful with signal levels in
the Part-15 range.

I don't know what I'll wind up with, but it'll be interesting. I'll
share when it's soup.

Mike-

I think you are on the right track with the RF log-amps.

Another idea - I understand the MFJ-259 has a standard SWR configuration
with a built-in signal source that uses an ALC to keep forward power at
the equivalent of full scale. Why not replace the 259 signal source
with the HP 8640B?

I hadn't thought of that. I suppose I could put a jack on the 259's
case, and a switch to select the 8640B, which has _marvelous_ ALC all
its own. The switch, and some RG-174, ought to be good enough for what
I'll be asking them to do. But that changes the question to "Is the
259's SWR sensor good enough above 175 MHz, and especially around 33
cm to 25 cm, to give real-world answers?"

I'll never know if I don't try.

I may have to buy a factory UHF-and-above antenna analyzer to validate
my answers, of course. I'm sure W5DNA will understand why we're eating
potato soup for two or three months.

Thanks!

They can be ordered directly from Philips -- as of a couple of years
ago anyway. Also, www.findchips.com shows a few vendors that sell them.

I'd start by measuring a standard or two. You can get pretty decent termination resistors on eBay for a modest cost. If your system measures close to 1:1 when terminated with one of those, you're off to a good start. Next I'd make up a 50 ohm microstrip line terminated with a 50 ohm chip resistor. If that reads close to what the 50 ohm termination did, then I'd measure the SWR with some different load values, say 25 and 100 ohms. These of course could be made from two 50 ohm chip resistors. You could get more elaborate with the calibration by introducing reactive loads, but just the three data points should be enough to give you some confidence in your SWR measurements, at least near 1:1 where your primary interest is.

As the Christmas season draws closer, many of us who have watched the war in Iraq have wondered how we could help or "make a difference" to the lives of some of our Soldiers, Sailors, Airmen and Marines who have been wounded in combat.

Although there are several military hospitals that take in the wounded, most find their way into Walter Reed Army Hospital.

Please take a minute to fill out a Christmas card and address it as follows:

A Recovering American Service Member
c/o Walter Reed Army Medical Center
6900 Georgia Avenue, NW
Washington, DC 20307-5001

Perhaps a personal note of thanks and gratitude for the sacrifice they've made would be appropriate.

73

So much for YOUR claim that you don't go off-topic on "legitimate" posts.

And considering you keep insisting you're a "legitimate" Veteran, I would have thought that the topic of this ONE thread would have been immune to your babblings.

Silly me.

Steve, K4YZ

steve you are just trying to divert from your years of trashing the NG

you want to do something for christmas apologize for your words and
Stopp trying to use veterans to make yourself look good steve

As the Christmas season draws closer, many of us who have watched
the war in Iraq have wondered how we could help or "make a difference"
to the lives of some of our Soldiers, Sailors, Airmen and Marines who
have been wounded in combat.

Although there are several military hospitals that take in the
wounded, most find their way into Walter Reed Army Hospital.

Please take a minute to fill out a Christmas card and address it
as
follows:

A Recovering American Service Member
c/o Walter Reed Army Medical Center
6900 Georgia Avenue, NW
Washington, DC 20307-5001

Perhaps a personal note of thanks and gratitude for the sacrifice
they've made would be appropriate.

Just one comment, about halfway down....

3 volts into 50 ohms isn't much power. ~3/50 of an amp, means about 180 milliwatts. The most sensitive calibrated SWR meters will read zero to 5 watts full scale, so 180 milliwatts might move your needle for forward power about 5-10 degrees of arc away from the leftmost peg towards the rightmost peg on the dial. That doesn't give you much indication of reflected power

since a 3:1 ratio would then mean movement of the needle about 2.5 to 5 degrees of arc, respectively. The elcheapo CB SWR meters _might_ be more sensitive since more power _should_ transfer to the measuring bars because 2 meters is some 5 times higher in frequency and the CB SWR meters are meant to operate at max 3-4 watts of RF output from the CB rigs. But, you'll have to try it.

Sad that you are too fucking stupid to know otherwise. I don't have anything against anyone's religion. I asked a question. As far as I can tell the word does not exist in your context.

An Anti-Semitic remark would have a derogatory nature to it. Mine didn't,
Moron. I've met many Jews I like. You just love to be a victim, pussy.

Hey all,

I'm trying to clean out the parts cabinet. So free shipping on all orders until I say otherwise.

My parts are new, but old stock spurplus. They are not pulls, and they have never been used. Most are gathered at hamfests, and some are gathered from eBay, some from surplus auctions, some just show up.

See the website below for details.

http://www.hamradparts.com

All right, I'm hoping someone here can clue me into finding the one(s)
I want. What I need is a handbook that has schematics for tube
equipment circa the 1960's. I have a boxful of tubes from television
sets from that era, and I was hoping I could put together a receiver
from some of them. I do have the first volume of Impoverished Radio
Experimenter, which talks about using "newer" tubes in older
schematics, but the scant few Lindsay talks about aren't among the
tubes in my box.

I've found a very good used book search engine, but unless I have a
better idea of what to look for, It's going to be hit and miss. Any
help would be greatly appreciated.

Ralph

The above link should prove helpful. Future Electronics has a pretty good selection of Philips components. The only catch is that you have to buy a rail of 25 at a time. At the price of $2.65 cach, that isn't too bad. When I buy SA602s, I usually buy 100 at a time. I've got around 100 of the 605s, but who knows where they are. I put them in a safe place, along with the two evaluation boards. Unfortunately, it was too safe of a place!
Give Future Electronics a call.............they will be able to help you. If you can find some friends to split the cost with, that always helps.

Just about any year's Handbook from the 60's would have what you're
looking for. They really didn't change that much from year to year.

But if you're just looking for projects, any of the magazines would have had plenty, and it's just a matter of picking them from the right years so they not only use tubes, but of the right vintage tubes.

And if you can't find old magazines, you can get QST on CDROM, so a volume of that from the right time period would supply plenty of projects. Of course, most of the projects in the Handbook came from QST to begin with, so it's not like you miss much in the project department.

Of course, a lot of TV sets were AC/DC, so the filament voltages are all over the map since you'd put them in series to run directly off the AC line. Unless they start with "6" or "12" the tubes may not be so useful.

Depending on the vintage of the tubes, you might trouble finding data on them.

In the '60s, TV manufacturers made a lot of extra money by changing the tube lineup every year. This required service shops to buy several sets of new tubes every year as replacements. Typically, the innards of the tubes were virtually identical to older ones, but with different pinouts, filament voltages, and combinations of tubes within the envelopes. If your tubes are from this era, you probably won't find them in the Handbook. You might have to get one of the later RCA tube manuals for tube information, then compare specs with various tube types used in Handbook projects to find projects you can build with the tubes you have.

Good luck!

=============================
Being in series means they would all be used with the same filament
current which can be easily implemented with a circuit employing a 78xx
device in constant current mode (obviously in a DC environment)

I know exactly how you feel. I was interested in ham radio since my early teens. I tried learning the code severel times over the years. There are always those who will say you didn't try hard enough, or you used the wrong method, or you didn't care, or you wern't dedicated enough. There is more to life than studying CW. I'm not a EE but I made a living as a electronic tech for 36 years. In retirement I finally learned enough code to barely pass the test. I went to the testing session prepared to pass the tech test. I got a general class licence from that session. 5 more correct answers and I would have been a extra. Three weeks later I passed the extra test. The elmer who introduced me to amateur radio 40 years ago is probable long dead. It would be nice to tell him I finally made it. I still don't know the multipication tables. The end of CW testing is long overdue. You will be an asset to amateur radio.
John

Hi,

Probably a question for Tom, but others are welcomed to answer too :-)

I've finally got my hands on an HP4195A (0-500MHz and freshly caled) and
also the 41951A impedance set + 16092A fixture. Unfortunately the 41951A
has been badly tempered and the calibration kit (short and 50R load) is
missing.
After some time spent I've fixed the 41951A, and seem to have a fully
functional unit (checked through calibrating it *with* the 16092A
fixture and a pair of selected 100R-0805 as the reference load).
At least the measurements I could do make sense, so far.

Now I'd just like to have all the possible accuracy from this and thus
want to rebuild an APC7 cal kit I can trust.

The original parts aren't available anymore, just 2 50R load left at
agilent at a (cough) $1350 price! and no more short.

I've found agilent has the 909C load which should be OK (given for
SWR=1.005 @ 2GHz).
I've also found an Amphenol short which should be OK since, AIUI, the
short is made by compressing a flat piece against the ref plane of the
mating connector.

I also want to add to this an APC7-SMA adapter for some on board
impedance measurement.

I believe all this would be perfectly OK but since I have not much hands
on experience with VNAs I'd just want to make sure.

Oh, last point, for those knowing it: I don't know if the open load
(04191-85302)is complete or not (it has an opened threading at the
opposite of the mating end) and could I find any picture/doc of it.

Any comment much appreciated.

--
Thanks,
Fred.

I was in Powell's Technical Books the other day, they had several from the '50s and '60s.

This link will get you several listings (and I'll get a kickback if you buy one!). I already grabbed the 1944 issue (thank you thank you thank you for making me look!).

Here is a site with lots of FREE books dealing with tube design. There are old ARRL and Orr radio handbooks as well.

http://www.pmillett.com/tecnical_books_online.htm

The files are huge so you better have a high-speed (not dial-up)
internet connection.

Have fun - Roger

How do you know Vince, I mean other than a seeming like a, unbalanced at
times, Morse code advocate?

that is How I know though his insane staement during recent his all
but incessant diatrbe of insult many derected at me by name

the Gay bashing and the bashing of the disable the tech indeed all new
hams of anysort

the person known here as SC is insane and inhumnne nutjob

if Vince in he then vince is not someone I care to know further, Vince
is merely claiming to be SC I still don't want to know him

All right, I think I've found what I'm looking for, but I'll need some
```

help. I found something on textfiles.com that looks to be close to what
I need, but there are some things that aren't quite clear.

http://www.textfiles.com/hamradio/convert.txt

If anyone can help me with the schematics and parts list, I'd
appreciate it.

Ralph Glatt

Wow, read through some of your blog and other pages your blog refers to.
You are quite the lighting rod. You should not be surprised to receive
much attention any many areas.

Best of luck to you.

Chris KC8FRJ

Tubes can be fun. Just be careful not to get zapped by the high voltage
power supplies..that isn't fun.

EMP? If your radio is subjected to one of those you won't be needing a
radio.

Have fun with the tubes and 73,

Bill KU8H

attention is one thing

but your "friend" (or the person you are speaking well of) has in the
last few managed to insult over 300,000 of your fellow hams and likely
the future of Ham radio

sadly in America it is acceptable to blame the target of the attack
your "friend" is one those people he has stated he would rather not be
a Ham than Me allowed to use HF I sugesst he consider following
thorough on his words
>
>Best of luck to you.

luck I don't need

I can if needed make all the luck I need

I know a guy down in Ga that made a replacemnet for these. I tused a couple of FETS i think and the whoile cicuit could be built on a DIP header. The limitation of the circuit was that it was not as flexible as the origional, In other words it was not directly plug in compatable all the time but he could always get it to work with a little modification. He is retired now but I usally see him whenever I am down there for Xmas. I doubt if he would want to build any but he would probably share how to build and tweak them with anyone who wanted the info.

Jimmie

Ever since I was a kid, I wanted to be a ham. I could never learn the code. It seems I have a very difficult time memorizing. I didn't know my multipication table until 8th grade. But somehow I managed to get a master's degree in EE and worked as a consultant on a satellite at MIT. Yes, it's still working after 10 years.

Now that all the bands will be available to me, I can finally become a ham.

Oh, and to those who think the waves will be flooded with idiots. Don't worry. After all this never happened to the tech band as far as I know.

Al

But of course, your problem was in thinking you needed to memorize the code. What you should have been doing is listening to the code sent at high speed, actually the characters at high speed with lots of spacing betweent he characters so the overall speed is slow, so you hear the sounds of each individual character, rather than a set of dots and dashes. You never go near a code key until you can receive properly, and you basically toss out all those alphabet to code charts.

Just think of all the time you could have had if you'd stuck with it as a kid, rather than thinking it was a matter of memorizing the code, and then thinking you had problems memorizing things.

Learning morse code when I was 12 was one of the easiest things I ever did, and the only reason I waited till 12 was that before that there was a rule in Canada that said you had to be over 15 to get a ham license.

I should also point out that rec.radio.shortwave is not about amateur radio. It's about reception, and only when someone is talking about listening to the amateur bands does amateur radio really become on-topic here. The fact that some decide to spew their junk out of the rec.radio.amateur.* hierarchy here does not make amateur radio on topic.

  Michael

Notice: Effective January 1, 2007, BAMA will add only manuals with a direct connection to the tube era of ham radio. Only manuals for amateur radio transmitters, receivers, antenna tuners, antennas, keyers, etc. will be added to the collection. The only test equipment that will be added will be those items already listed on the "Needed" list and those items created especially for the amateur radio market.

While I appreciate all the contributions of those whose interest is in test equipment and military equipment, I simply cannot continue to expand the BAMA collection in these areas at this time. I will not be removing the test gear and military manuals currently on BAMA. The BAMA collection will remain intact. I just won't be adding to these areas for the time being.

I want to thank any and all of you who are reading this and have contributed to the BAMA collection. Without your time and effort, BAMA would not have been possible. Thanks again and best wishes to all for the holidays.

73,

Ken K4XL

Some people never learned the code because they are lazy. Some were
afraid of the very idea of learning the code and never tried. And there
were some who really DID try to learn the code, but for some reason were
not able to. It is a fact that some people just CAN'T learn another
language. (I for one barely got through French in High School). I DID
manage to learn to copy code up to about 15 wpm though. I jealous of
those people that make 45 wpm copy look easy! Maybe it's easier if you
start real young (just as with piano lessons).

I have a good friend that I meet though a mutual interest in model railroading. He also attends most hamfests. He was a CB type, wanted to get a ham ticket, but the code was a roadblock. He eventually got a code-free tech license. (he also eventually, learned the code, just enough to gain Novice privileges).

So don't downgrade people for not being able to learn the code. It CAN be a real roadblock for some people.

Lowest noise does not equal highest gain.
Highest gain equals source impedance equals system impedance.
So, LNA equals source impedance gives not necessarely lowest noise.
Tune LNA for lowest noise, the gain will be somewhat lower.
Its the S/N ratio that counts especially important for an LNA.

What exactly do you mean by "will not work properly"? There are a lot of effects possible; reflections on a transmission line may cause "ghosts" in an analog video image, or an improperly terminated filter may not give the needed frequency response. But there are ways around those problems: put the LNA at the antenna, or design the filter to work into the load impedance it will actually "see." Or maybe the lowest possible noise is not a requirement, and you can optimize system performance with a tradeoff between noise and some other parameter.

Lucky indeed is the designer who is able to optimize all parameters at the same time. A big part of design is often selecting the tradeoffs so the overall system goals can be met with enough margin to let the system operate reliably.

Also, you may be surprised to find out just how little gain is sacrificed by using an optimal noise match instead of an optimal power match, or how little a filter's performance is altered by tuning for minimum noise figure.

Finally, can you think of a way to alter the amplifier's input impedance in a way that does not degrade noise, so that you come closer to an impedance match while maintaining a match for optimal noise?

Cheers,
Tom

I have a 40 amp, 13.8v supply and would like to add a voltage (0-15v) meter and an amp (0-50amp) meter. The meters look frail and I can't imagine running all that current through those flimsy connectors and tiny meter coil. I have no paperwork on the meters and was wondering if I need a shunt resistor or something to take all that current. Any ideas? Thank you.

Cordially,
west

yep. the amp meter will definitely need a shunt. that value is dependent
on the actual coil current for full scale.

the voltmeter can just wire directly across the output voltage
terminals, but the ammeter will require a shunt.

if the full scale is 50 amp, and the meter is a 1 ma movement, then
49.999 amps must be taken care of in the shunt. the value of the shunt
can be found like this:
you need to apply enough current to the ammeter to get full scale. this
will require a very careful setup.
then measure the voltage across the meter terminals.
now you know V and I.
then you can calculate R for the shunt sine it will be V on the meter,
and 50.000 - the current required to get a full scale reading on the
ammeter.

If the volt meter is not already calibrated it will require a resistor in
series with the positive lead.
Depending on the movement of the meter the resistor could be around say,
49Kohm.

Good luck, Ken, G4KIR.

I have no paperwork on the meters and was wondering if I need a shunt resistor or something to take all that current. Any ideas? Thank you.

In many cases you should already have a suitable shunt resistor installed. In power supplies built around the 723 voltage regulator IC, there are is usually a low resistance (but high power handling) resistor for the short circuit protection (usually between the power transistor emitter and power supply output). When the voltage drop across this resistor exceeds about 0.7 V, the short circuit protection will kick in, limiting the current.

By measuring the voltage drop across this resistor, the output current can be determined. By using a moving coil instrument and a suitable series resistor, the meter can be easily calibrated.

Since you have a 40 A power supply, there are most likely several power transistors in parallel, each having a low resistance resistor at the emitter to balance unequal currents through the power transistors.

The voltage drop across one of these resistors could be used to give an estimate of the total current. This is just a rough estimate, since the currents through the transistors varies e.g. with temperature (the transistors at the end of the array may have a lower temperature than those in the middle of the heatsink), the currents are not exactly equal, so multiplying the measurement with the number of transistors is not very accurate, but may be sufficient in most cases.

Ummm...it's early here so maybe I missed something. The meter CAN'T just be placed across the output terminals to measure output voltage. It will need a series resistor in one of the leads. It's value will need to be calculated as well.

Some friends and I have been looking into making antennas for 70 cm.
and higher frequencies, but we don't have an MFJ-269; my MFJ-259 tops
out at 175 MHz. I _do_, however, have an SWR meter that supposedly
works up to 500 MHz(and maybe higher), and an HP 8640B that is good
to about 1.2 GHz.

If the SWR meter is sensitive enough, could I get at least ballpark
SWR values using the 8640B as a source, running the signal through
the SWR meter to the antenna? Or am I way off in left field?

Thanks very much for the info Jimmie. The mixer is for a home brew project,
so I wouldn't mind building-up one.

If you could have him emial a brief description of his circuit, I would
appreciate it. email at: w9nm at sbcglobal dot com

73, Emil

that is entirely possible.  in general, I have seen voltmeters that are
already cal'd with this resistor internal...
this might have been special case (s). it has been a while.

What kind of "SWR meter" are you talking about?  The '8640 may or may
not have enough power to be suitable.

A fairly el-cheapo no-name, but appearently good-enough on 2m and from
420 to 450 MHz. I haven't fiddled with it to see how much drive power
is required.

I suppose I can get a couple of RF amplitude measuring chips and make
the critter active instead of passive, if necessary. The 8640, IIRC,
is good for +20 dBm (3V) into 50 Ohms, or a lusty 180 mW flat-out, but
the finals on the 8640 are unobtainium and so I'm minded to stay well
below that -- and even lower outside the ham bands.

Mike-

You have to try it to find out.

One problem is that your SWR meter's diode output is non-linear for very low voltages, resulting in SWR being higher than indicated for low values of SWR. You may be able to get around this with a hand-calibrated dial on the meter, or a calibration correction chart.

Negative feedback increased input impedance. It looks like lossless negative feedback will do this without also increasing the noise. Perhaps use this to make the input impedance equal the noise-opt impedance- then you can match the two together to the source (using a transformer or a tuned circuit).

Here is a nice reference:

http://rfdesign.com/mag/radio_unique_inductive_feedback/

The lossless feedback can be as simple as an inductor in the emitter or source lead.

I've found lots of other references (mostly for-pay IEEE papers), it looks like stability can be a big issue- no big surprise in a feedback network.

Analog devices makes RF-log amp/detector chips which are good to microwave
frequencies (basically RF in, 10mv per dBm out, from -80dBm to 0dBm).
Replace the SWR meter's detector with one of these.

...

Right. Well, actually, you can use negative feedback to either increase or decrease the input impedance, and to either increase or decrease the output impedance. Negative feedback applied as a current into a summing junction (as in an inverting op amp circuit) decreases the input impedance. Negative feedback applied as a voltage in series with the input signal (as in a non-inverting op amp circuit, or by using a source/emitter impedance) increases the input impedance. Feedback derived from the output voltage decreases the output impedance (tries to hold the output voltage constant, for a constant input signal). Feedback derived from the output current increases the output impedance (tries to hold the output current constant, for a constant input signal).

Just as you say, though, feedback can be difficult to apply at RF, and especially so at the very high frequencies where noise figure is typically the most critical.

Cheers,
Tom

Andy writes:

I built one of those up -- the version that goes to 500 Mhz -- and I use it with a Mini-Ckts Fwd/Ref bridge and a Measurements 202, which only puts out around 0 dbm.   It works like a charm. I use the 202 to get reference measurements and use that system to tune antennae and transmission lines.

It's a very very sensitive RF power meter and, while the absolute accuracy may not be the best, it's very good for using low power signal

sources and taking relative measurement.

Regulated Linear Power Supply Construction
What's inside your Astron�?
David Metz, WA0AUQ

I have often referenced David Metz's (WA0AUQ) article on Linear Power Supply Construction. David wrote this article for the SouthEast Iowa Technical Society (SEITS) newsletter in November 1996. Sadly, SEITS and its web site are no longer on the Internet.

Kevin Custer, K3KKC has agreed to add this article to the Astron folder in the Repeater Builders Technical Information Page (RBTIP). Hobbyists can

again access this informational and educational article on linear power supply construction (Adobe Acrobat format) here:
http://www.repeater-builder.com/astron/seits-astron-article.pdf

w9gb

BTW Meter labeling is also quite easy

===

The measurements derived from PSU fitted operational meters do not need to be very accurate.

To make the correct series resistor for the voltmeter and the shunt for the current meter you need a digital volt/mA meter ,preferably with a 10 Ampere- DC range included.

For both measurements a moving coil meter in the 0.1 -1 mA range will be fine . For the current meter a say 10 mA full scale meter will be OK.

Try to find moving coil meters with a 0-15/0-20 and 0-50 scale.

You probably will find these at a fleamarket/junksale.

To find the respective full scale current of the respective (mystery) meters ,take a 1.5 V battery and put the DVM and the meter in series with a 22 KOhm linear potmeter , adjust potm. until mystery meter reads full scale and read current on DVM.

Remove DVM from circuit and adjust current again to full scale.

Measure voltage (probably in mV range) across meter.

You now know everything of meter you need incl the meter resistance.

Voltmeter: Calculate series resistor (probably odd value) and use a fixed resistor or resistors or 1 resistor in series with a suitable (10 turn) trim pot.

Apply say 10 Volts across system (measured with DVM) and check meter deflection . If not to your satisfaction ,change fixed resistor or in case of using a trim pot ,adjust the trimpot.

Ampere meter:

Take approx 1 metre of thick copper wire capable of carrying 50 Ampere , meaning that at that current its temperature does not get noticeably above ambient .

Make a current of say 5 Amperes to flow through the wire .

With the DVM determine the length of the wire over which a voltage developes which is 20-30 % (not critical) higher than 10% of the full scale voltage across the designated Ampere meter ,assuming its scale is 0-50.

You can now reduce the overall length of the wire shunt accordingly.

Connect the designated meter in series with a (preferably 10 turn) trim pot ,with a value of the same order of magnitude as the meter resistance, across the shunt and adjust the trimpot such that with a current of 5 Amperes (as measured by the DVM) the now Ampere meter reads 10% of its scale.

Increase the current to say 20 Amperes (as shown by the DVM or any other Ampere meter) The now Ampere meter should read 40% of scale.

I have applied the above with 'junk box' meters to measure voltage and current from 2 solar panels (0-10 A) and a wind generator (0-20 A).

Voltmeter reads 0-15V.

The method described is adequate for 'operational' meters . Their uncertainty (accuracy)is better than 3%.

If the meters you have don't have the wanted scale ,you can change the scale by (carefully)glueing a paper scale on top of the existing one . There are a number of free meter scale programs available from the www

You can achieve a lot on 70cm with an HT and a simple field strength meter. Think matching stubs & shorting bars...

Hi:
Does anyone know where I can get two or preferably four Toko RWRS-T1018Z coils? These are 180uH adjustable coils in a 10K shield can. I want to build the BC band preselector by Joe Carr in the April 1995 issue of Popular Electronics.

Thanks,
Bob

Anyone got a source for SA605 or SA615? I want to build the 1-chip
receiver that Steve Hageman describes in EDN Access of 25 September
1997, but am having problems finding the chips. Maybe I'm looking
past them.

Nominally these are Phillips parts (now NXE or whatever). They use the

'SA' 'NE' etc., for indicating temperature ranges -- I know I've had trouble finding '602s with one prefix, and no problem with the other.

Good heavens, Bill! I appreciate the sentiment, but you do realize that you've become just another disruptive poster on the newsgroups. I don't see the jerks, but I do see your posts to them. Someone is always trying to "Clean up Dodge City", and they always fail. Give it a break, and excercise your filters!

Does anyone have documentation for a Command Technologies HF-1250
amplifier? I've searching the web with no luck.

Yes, tubes. I have some that were pulled from circa 1960's television sets, and I thought I'd use them, hoping that they'd be EMP resistant. Been on kind of a survivalist kick, lately. Doesn't mean I'd be opposed to using more modern equipment, though. One thing I saw that I liked in one of the books I purchased was a loop antenna that uses transistors to amplify the signal. Thought it might be easier than stringing up a lot of wire. ;-)

I'm not that terribly fond of Rush, but I think I might be able to
adapt this to tune in other frequencies, so it should come in handy.
Thanks!

But the transistors almost certainly will be fried by EMP. If that's
not a concern, then by all means try it -- and share the design and
results with us, please!

If that was the test you took it explains a lot.... It sure explains
why you are so fearful of the CBers taking over. You never passed a
valid exam, so you might want to turn in that ticket and try again.
Let me know where you are and we will find you a testing session close.

We still don't have your call there SC.  I'm thinking that you may not
actually have a call and are just jealous of us folks that passed the
tests.. (Grin)

Newsgroup wrote:

> I am currently in the process of building a eb104 kit. has anyone else built
> one of these kits. What are your thought on this amplifier.

It is not actually a kit. It is the circuit board plus all the components to populate it. To have an actual working Amplifier that you can get on the HF bands you will need: T/R relays, low pass filters for the bands you want to use the Amp plus a means to switch these filters, 50 VDC 20 amp power supply, copper spreaders+heat sink+cooling fans to get rid of the heat, some kind of enclosure with switches, connectors, metering ect..

Optionally, you may want an ALC circuit, and an SWR protection circuit. The MRF150s are about $80 each, I let the smoke out of 8 before I got mine working. I built two eb104s with a combiner for 1200 watts output, but it was a struggle. Essentially you have to come up with your own kit. It takes about a hour to populate the eb104 circuit board. It took weeks to have a working Amp. Good luck.

Does anyone have a manual for the Watkins Johnson WJ-8718 and could scan the
mixer circuit in the input converter and email it to me? Or better if
anyone has a spare input converter that they'd sell, it's A3 791592. Or the
mixer module or a mod that allows one tho use a Minicircuits mixer module.
tnx

I'll admit that the idea of a tube receiver is partly based on looks than EMP survivalbility. (I managed to find eight wonderful old headsets at a school sale. Bakelite earpieces and cloth wrapped wire!) I thought it might give me more of a 50's era Cold War feel. I'm sure I'm not the only one who likes using tubes as well! ;-)

As far as using solid state, I wouldn't be opposed to it, especially if I could figure a way to shield the parts from EMP. The main reasons I wanted to adapt a car's AM radio was because they're cheap (I know for a fact there's one at the local resale shop) and have a certain amount of shielding, plus they run on 12 volt DC. I've discovered they have plans for a shortwave converter in another of the Impoverished Radio Experimenter's books, so I might look into that. There is also a bit of that post-apocalyptic feel of using "junk" to listen to the airwaves.

I'm seriously considering getting a ham license. So far, the only thing holding me back is learning Morse code for CW.

Thanks to all who have posted with suggestions, advice and comments.

Ralph Glatt

  Hey thanks, Bill
 I downloaded a few of your programs and installed them on a MP3 player.
My first attempt at such a thing, it all went smoothly, I listened to the
discusion
while on the treadmill and while working the weight machines this morning, I

enjoyed the conversation. I'll be adding more soon.
I bought a cheapy MP3 player at FYE, hold on now, list price is $29.99, it is on sale for $19.99 and has a $10.00 rebate. So the final cost is about $10.00!
Works fine but it is bare bones.
Thanks again for the feed,
Mike

Do a search on Code Quick. I think the URL is www.codequick2000.com or something like that. It's a combination audio/visual/tactile system that teaches you how to copy morse code as if it were words and not beeps.

Worked great for me, I tried for 29 years and never was able to get anywhere near 5 wpm. With code quick I was able to pass the 13wpm test and at my peak copy at 35wpm.

Best $50 I ever spent on the hobby.

Geoff.

   He won't see this reply. He is an Earthlink subscriber,
as am I (Netcom is an Earthlink company). For the past
several days Earthlink's news servers have not been updating
messages. Only a very few groups work, the rest have no
messages newer than about 8 December. You can download
existing messages and post but new messages just don't show
up.
   I've been using Google groups and am now using a freebee
Teranews account.
   Earthlink is a godawful provider but one hears horror
stories about most of the others too.

Heck your hot mail dont work my links dont work. so try nj7p's tube data web page I'm sure it has a link to an RCA tube manual. In the back of the RCA tube manual is many a circuit an the older the manaul the better the tube circuits are or were. I recall a converter or two back in the day, all tube radio, on a points/distributor ignition system car, yeah vibrators those were the days. You know the trick to clean the contacts on a vibrator 100 watt light bulb in series with the coil and plug it into the mains

Then just about the time tung sol invented the 12VDC plate voltage tube, transistors took over.
I even know how to make a tube out of a dual filament car taillight.
Now there's a real tube.

==========================
You currently only need to do a 5 wpm morse (receive only) for the
highest class of licence ,giving you all the privileges available to a
licenced radio amateur.
So you can start with with getting licences with not all the privileges
and enjoy operating before you go for the Amateur Extra class of licence.

I know these have out of production for a while. If anyone knows of a
source for a dozzen or so, I would be greatful I you would share your
information with me.

Thanks,
Emil

I assume that you have contacted Command Technologies (e-mail or phone) and
they have told you they no longer have this documentation?

First Google.com search hit found their web page:
http://www.command1.com/default.asp

Did you also contact QRO Technologies ???
http://www.qrotec.com/

Since the HR-1250 was a Command Amplifier was before Patrick Stein, N8BRA
(Command) and Ray Connin, KB8VU (now QRO) "split of the companies" a few
years ago.

What do you do if the input impedance of an LNA does not equal the source impedance which gives the lowest noise?

The source might be an antenna, transmission line or filter which will not
work properly if it does not see the correct impedance.

```

Hank,

We appear to be crossing paths or whatever that cliche is...

I did not receive your email because I forgot to change
my old (obscured) email address in my news reader program.
I sent you a note to what I thought your correct email address
should be based on what I saw in your post, but I guess you
did not get it either.

Anyway, send me your mailing address using this email address
for me:

  pj2006 at alltel.net

(you know what to do with the "at" part)

I'll fire off the manual via media mail through USPS. You should

```
have it in 7 to 10 days according to the post office.

73,

phil

No, I had not tried them, but have now sent off an email to them and
will see what their responce might be.

Thanks for the suggestion.

The HF-1250 used a single 3CPX800A ... so it really is a single tube version of the HF-2500.

I have not received a reply from Ray at QRO and, no, he has no
documentation for the HF-1250.

Besides the HF-1250 using only one tube there are other differences
between the HF-2500 and HF-1250.

Thanks for the suggestions.

Possible changes to some components for current and power increase.

One tube designs are not always economical -- when the cost to add an
additional tube and parts changes is small (on a unit cost basis) -- you
already have the case, meters, transformer (possibly a bit higher current
ratings) and relays. IF the specific tube used in the amplifier is

inexpensive -- that is usually the deciding factor.

This is veering off the question, but will make a couple of comments
and then drop it.

I've been able, thus far, to determine that the band switch is
different (the HF 1250's is better!) the tank coils are different and
also is the 4:1 transformer (location and size). Oddly enough, the
power supply is the same! The HF 1250 power supply really loafs along.

Another factor, for me, was I don't want to spend the $$$ to put in a
220VAC service and for amps running 500-750 watts (we're talking key
down here) the single tube amp is a good choice. There's more than
just the cost of the amp itself involved.

Now back to my original question.

73,
Danny, K6MHE

Sounds good, I'll have to check it out.

I wouldn't mind knowing how to do that myself. One of the really good
radio books from Lindsay tells how to make your own vacuum tubes and
transistors. I'm thinking of picking that up as well.

I've been told that "real" hams know code. For now, I'm mainly
interested in listening to news from outside the US and possibly any

Civil Defense frequencies. Would definitely be interested in listening
into any frequency that plays old time radio programs.

Ralph Glatt

There was a place on the East coast, maybe in New York, that was selling
them for about 90 dollars for a rail of 25 of them.
I don't have the name of them anymore. Some of the other places were selling
them for 225 dollars per rail.

I, too, would like to see a circuit which demonstrates that "tube"
did something useful. Is it just a diode (i.e., rectifier), or
can it also amplify?

I am NOT an expert, but I can tell you what I did for the base of
my 20-foot (when lowered) tip-over/crank-up tower: I purchased
an 8-inch diameter 6-foot long pole ("corner fence post") treated
against termites, cut it in half, sank the two halves side by side
until only 3-4 inches showed above ground, placed a five-sided box
made of treated 2-by boards (2x4 around the sides and probably (I
don't remember) a 2x12 on top) over the top, bolted the sides to

the posts, and mounted the base on the top with some long bolts straight through the 2x12 and down into the posts.

The above base is about a foot away from an outer corner of my front porch, and above that porch is an upper deck with a 4-foot-high railing (railing is maybe 14 feet above the tower base). My tower came with a kinda-Y-shaped gizmo probably made to attach to the side of a house to hold the tower upright, so I attached that gizmo to the railing (after reforcing the railing both directions).

I use a spur-geared (? May not be the right word, but it MUST be cranked to raise AND lower) crank gizmo (my brain must be giving out - I can't think of the correct words!) and long cable for lifting and lowering the tower (always when the tower is cranked to its lowest position, of course).

Installable by one person, no concrete, no rebar, not "engineered" in the usual sense, but I live in the country with no houses nearby so I didn't have to follow any "code", and I feel quite comfortable with it. (If I didn't, I wouldn't have done it that way!)

Awww, c'mon Slow!

To use the vernacular of the left, "It was the Exam, stupid." The mode hasn't changed... hell, it hasn't changed since the 1840's! What needs to change is your attitude about how to entice folks into the Morse Code fold. Since the government stick is gone, you'll have to sell Morse Code on its merits. And here's one last hint, you'll attract more folks if you use sugar. Good Luck.

Contact the tower manufacturer (it'll probably be Glenn Martin or Rohn). They will be happy to give you the specs.

Happy raising.

I am actually surprised to find out it was/is Vince. He's an O.K. guy, puts in volunteer time and is very knowledgeable. While I firmly believe this alter personality detracted from Amateur radio (Slow Code), Vince has done other things to advance it.

Although I know Vince is very pro Morse code, I am having trouble believing it was him (being Mr. Slow Code)

If it was/is him, turning in his license would only be a detriment to the community IMHO.

Great idea setting the tires on fire,but they should of started a huge forest fire in the area. going to prison for starting a forest fire is way better than dead!

If the antennas you're talking about really did work, you did not
violate any laws of physics, I can assure you. :-)

I operated with in-attic antennas for years and they do work
surprisingly well. I earned DXCC with 100 watts and an attic dipole in
a matter of a few months.

Go for it.

Well SC, just open the stall next time you're on duty at your job of
restroom attendant at the hamfest. You'll have your answer. And I ain't
tippin you for that damn "Brut" cologne you hawk!

Andy , You didn't provide the shape of your roof space eg width at loft bottom and whether there is any metal around (apart from nails/screws etc).   For an HF roof space antenna I would recommend a wire loop as much as possible away from any metal and with total loop length exceeding the the length of the largest wavelenght you wish to operate on. So in your case a loop of > 10m or say 35 ft would be adequate

A square would be the optimum ,but a 'wide rectangular' is acceptable. Feed the loop with any balanced feeder ,twinlead electrical cable'(75 Ohms ?) or 300 -450 Ohms ribbon or 2 wires with insulator spacers.

It would be best to feed the loop somewhere near the middle of a side

You obviously need a balanced tuner/matching unit ,but might get away with a simple current balun

Good luck

Frank   KN6WH / GM0CSZ

> 1) Just above the roof peak, straight along it, about 1 foot above.

Is the ridge vent metal? Usually it is covered with shingles, but sometimes it is aluminum, sometimes plastic. I trust any foil backed insulation is in the floor of the attic rather than the roof.

All other things being equal, I would expect the antenna to be noticeably better above the roof, because there will be some attenuation indoors, and greater proximity to noise makers, and things that can get overloaded by your transmitter.. But I doubt it would be a huge difference, although on wet days it may well be sigificant. If the vent is metal, then the attic antenna, because you can get it farther from the vent, may well be better.

But "better" is a relative term. I suspect in 4-land you don't get the snow and ice we get up here on the tundra, but I imagine you have pretty decent storms come by once in a while. It may well be that the slight attentatuon is a small price to pay for not having to re-string the antenna every time hurricane season rolls around.

Starting a forest fire in the middle of the freak'in winter?
Highly unlikely.

and there of course you are plain wrong

Neither Morse code nor cw has been truly basic to Ham radio at any time
in our history in making this statement you spout bogus propaganda

Morse Code has NOTHING whatever to do with radio it just so happens to
exist and was apllied to first spark (which sure isn't CW) as it was
applied to various wired aplication

indeed the Morse Code test know even prove one can use Morse Code (as
can be seen by skimming the threads bashing newbie code users on QRZ)

indeed with you Dee we have a clear case of the dmage done the ARS by
Code testing

we have an extra class our most tested therefore in theory our most
knowledgable class of hma making down right stupid statement about what
Ham radio is

now it isn't entirely her fault of course she is product of th e system
foisted on one by the FCC allowing the ARRL to decide what we needed to
be real hams

it is rather like the case in B5 of Akara 7 where the leader fed propagnad about what made a real Akaran to leath weapons and turned them loose during an invasion the result was the they repelled the in vasion and killed off all of the inhabitants of Akara 7 as well

Dee Flint is a poster child for what went wrong with incentive licensing

Ahhh, well. That changes things.  A wire antenna is practically invisible,
but you wouldn't want it in the attic where it could attract lightning
inside the house.

Well that settles it in my mind, do it inside the roof as high as u can get it.
(use rope and pulleys so u can later play with it, when the urge hits)
It should work almost as well as of it were outside and 3 foot higher.
Easy to get the feel line to come away at a 90 degree angle.
(not necessary, but if it does great)

and last but not least
It will save up your exterior adornments play with the xyl for a later project.

Andy comments:

Well, the difference between being "practically invisible" and being pre-emminent in grotesqueness to my wife is "practically negligible" (grin).

I'm not certain that an antenna "attracts" lightning. It probably makes little difference between hitting an outside antenna, running in the feedline, and burning down the house VERSUS going thru a layer of asphalt shingles and doing the same thing...... but I can see where you're coming from.....

However, in Eureka we don't usually have problems with lightning because the tornado usually blows the antenna away before the lightning strikes......

I'm not the problem. The problem is the people that don't what to be
good skilled hams. They just want a welfare license, they don't think
they should have to learn or by skilled at anything to have one.

Ed, that's about right. The three pins at one end and the two pins at
the other.
Size is a little smaller, about 1-3/8" L x 1-1/8" W x 11/16" H (approx.
dimensions).
Again on the top it says - Freq. 10.000 MHZ
No adjusting hole like that diagram.
Hey, we're getting much closer!!

All right, I think I might have found the proper place to ask about this. Back in the 90's when GEnie was still around, they had plans to convert old AM car radios to shortwave receivers. My old Franklin ACE 500 computer wasn't capable of interpreting the file at the time, so I didn't get to download it. I'm hoping someone here might know where I could get the instructions.

I know, I could just get off my lazy ass, get an ARRL manual and figure it out for myself, but if there's an easier option, I'd like to go for it. All I'm looking for is something that will pick up broadcasts between upper AM and the scanner frequencies.

By the way, my hotmail account isn't working, so emailing me won't do any good. Please post where I can find what I'm looking for here.
Thanks.

Andy writes:

In my opinion, the easiest, most non-destructive way to do this is to add a converter, using the AM radio as a tuneable IF for AM transmissions.

A two transistor converter, using a xtal oscillator and a mixer, can easily do this. Just select the xtal frequency to be about 1000 Khz above or below the middle of the shortwave band you want.

I am assuming you are only interested in AM shortwave broadcasts. Any of the other modes would require modification to the inside of the AM radio....

Anyway, the neat thing about this approach is that no modification needs to be done to the innards of the AM radio......And you can still listen to Rush Limbaugh by switching off the converter....

If, on the other hand, you want to modify the AM radio to short wave without adding anything significant, it depends entirely on the circuit. In general, you will rewind a bunch of coils, which means you need equipment for testing and measuring. There are some AM radio designs that are such that success is extremely unlikely while others are fairly straightforward ---- it's like asking "how much does a rock weigh?"

I encourage the CONVERTER approach.... Good luck with your project. These weekenders can be a lot of fun and very educational...

Andy writes

Well, I've read the posts here, as well as the vitriol being thrown around, and it's obvious that a lot of people have strong opinions about the usefulness of the code test.

As a pragmatist , here is MY two cents worth.

1) No-code operators won't be on the CW bands, so those of us that us CW won't even know they are around.

2) Most, if not damn near ALL equipment being put on the air now are appliances bought in the store what have been type accepted. Consequently, no degradation of technical standards will occur, as MOST of the equipment are designed by professionals anyway, and I doubt that many no-code operators will try to build their own.

3) Those FEW, like myself, who build their own equipment know lthere is NO correlation between knowing Morse Code and the technical design of a radio. We learned Morse because we had to, and either learned to love it or promptly forgot it as we designed our

SSB and FM radios for the next several decades.....

4) Finally, the ONLY concern I have is that portions of the CW bands may eventually be taken away and given to the appliance operators. If interest in the CW bands dwindles, that's probably just an evolutionary step... However, having CW as a requirement will NOT make newbies want to use it when they can just talk into a microphone and jabber away. It's a new breed of internet-savy operators, and already the newsgroups (like THIS ONE) are attracting far more people who like to talk with strangers than an expensive appliance that interferes with the wife's TV programs .... I'm afraid ham radio is dwindling, but it will be around for the rest of my lifetime, and that's OK .....

That's how I see it. Having a code requirement is simply an obstacle to hurdle in getting a license. It may as well be required for a driver's license for all the "technical" good it does. On the other hand, it does give us Extras a sort of "elite" status for having earned it.... I'm glad to have the ability to have Morse Code, typing, memorization of the color codes, and good looks on my resume....

I'm not a ham, I just enjoy the discussions here.

My two cents worth.

When we got our first TV in the 50's, my father wanted to install an antenna but was leery of going up on the roof. I told him to put it in the attice. He did and it worked just great.

After we moved, we did the same in the second house. No problem.

Maybe the fact that we lived about 10 to 15 miles from the Empire State Building in NYC may have had something to do with it.

I now live about 2 miles from three 1100 ft. TV towers. The rabbit ears in my basement work just fine ;-)

I also get audio on my telephone. Grrr!

Al

Thanks, Andy. I think I've managed to find something a little better
than what I had in mind, anyway - Lindsay books sells a series of books
called the Impoverished Radio Experimenter. I've ordered two of them
that seem likely to have the information I need. My only concern now is
being able to run a tube receiver off of battery power, but I'm hoping
I can figure out something on my own.

Ralph Glatt

Andy writes:
  I agree with Bill W6WRT.

Since I have seen so many postings about this on this newsgroup, I
just ASSUMED that folks here wanted to talk about it.....

I did a "reply" using "google" to one of the other posts, and found
that it was multiply cross posted to a LOT of groups, meaning that
somebody just wanted to make a fuss...... TROLLING.....

I apologize to Bill, and everyone else here, for not looking more closely
at the subject before posting to rec.radio.amateur.homebrew

I can't say it won't happen again, ever, but I'll try to watch it in
the future, and would ENCOURAGE anyone who just hits a

"reply" button to check to see if it is being crossposted.... If it is,
please go to the group that is interested in it and don't plague
the newsgroups with spam....... as Bill and I have just done (grin)..

"AndyS" (andysharpe@juno.com) writes:
> Andy writes
>   Well, I've read the posts here, as well as the vitriol being thrown
> around,

No, the posts aren't here, they are cross-posted by idiots who think
whatever it is they have to say is so important that they need to spew
it across the newsgroups.

If you really wanted to address the issue, then you go elsewhere to
post, where such posts belong. At the very least, and you should always
think twice about it, you reply to the cross-posted junk rather than
start a new thread that is only in rec.radio.amateur.homebrew YOu can
even reply to those existing threads and take out the irrelevant newsgroups,
such as this one.

For most of a decade (and likely before) we've been relatively isolated,
as if the people who do all that cross-posting don't think that building
radio equipment is actually part of the hobby. But their need to spread
their junk has meant don't keep it in rec.radio.amateur.policy where it
belongs, they don't even keep it there and in rec.radio.amateur.misc
where it was often kept until relatively, they spew to all kinds of newsgroups
as they catch on that there are other ones. So they spew into
rec.radio.shortwave, and the spew into the more technical newsgroups like

this one and rec.radio.amateur.antenna

LIke Bill Turner said, don't reply to them. But that doesn't mean starting the arguments here in standalone threads, either.

If everybody would just take step one: Killfile postings from Google.

The OP:
Message-ID: <1165841619.210023.187380@j44g2000cwa.googlegroups.com>

Each posting that Bill has commented on in the rec.radio.amateur.* ng's was ooze emanating from Google.

Jonesy -- never seeing Google posts, but forced to wade past the followups.

Agreed.

>converter....

Or when you switch it on...

http://www.techlib.com/files/rushconv.pdf

Pick your 1MHz band, and tune away. You'll need to tweek a bit if
you want to be very far from 15 MHz.

Andy comments:

Excellent, David !!! Thanks for the circuit. Note that it can easily be modified to get WWV also...... I suspect one could use a CA3028 if one wanted to build it with a single IC, for some reason...

Yet another simple converter can be made using a NE602. I don't have a circuit handy, but it can easily be designed from the data sheet.

Andy W4OAH

PS I'm going to check out 15.42 Mhz --- I hadn't messed with it before.....
